FISH-BREEDING.—Report by the Superintendent.....	
--	--

FIRST ANNUAL REPORT
OF THE
DEPUTY MINISTER OF FISHERIES
FOR THE YEAR 1884.

To the Honorable

ARCHIBALD WOODBURY McLELAN,
Minister of Marine and Fisheries.

Sir,—I have the honour to submit herewith my first annual report on the Fisheries Service of the Dominion for the past calendar year, together with statements of official transactions for the fiscal year ending 30th June, 1884.

ORGANIZATION OF THE DEPARTMENT OF FISHERIES.

The Statute 47 Vic., cap. 18, divided what was hitherto known as the Department of Marine and Fisheries into two Departments, to be respectively called the Department of Marine and the Department of Fisheries, over both of which the Minister of Marine and Fisheries for the time being shall preside, and of which he shall have the management, charge and direction.

DUTIES.

The duties of the Department of Fisheries consist principally in the administration of all laws relating to the subject of sea, coast or inland fisheries, the management, regulation and protection thereof, and all matters and things relating thereto or assigned by the Governor in Council to the said Department.

Under this latter head is included the payment of fishing bounties, necessitating an enormous amount of labour, which could not conveniently and satisfactorily be performed outside the Department.

PRODUCE OF THE FISHERIES.

The total value of the fisheries of Canada for the year 1884 is reckoned as follows:—

Nova Scotia.....	\$8,763,779 36
New Brunswick	3,730,453 99
Quebec	1,694,560 85
British Columbia	1,358,267 10
Ontario.....	1,133,724 26
Prince Edward Island.....	1,085,618 68

Showing a total value of.....	\$17,766,404 24
-------------------------------	-----------------

as against \$16,958,192.98 in 1883; an increase of \$808,211.26.

This is exclusive of the quantity consumed by the Indian population of British Columbia, and also of the yield of Manitoba and the North-West Territories, from which, although steps have been taken to supply the information in future, no reliable data are available for the present report.

•

DETAILS.

The following table shows the value of the principal kinds of fish, grouped for convenience:—

Cod.....	\$4,302,454 85
Herring....	2,645,447 00
Lobsters.....	2,351,559 80
Mackerel.....	1,826,681 03
Salmon.....	1,357,727 64
Haddock	758,245 70
Fish oils.....	477,443 40
Trout.....	464,653 00
Sardines.....	384,600 00
Smelt.....	370,644 60
Pollock.....	275,222 50
Whitefish.....	271,971 28
Hake.....	217,981 70
Alewives.....	189,854 50
Seal skins.....	166,788 00
Oysters.....	126,458 00
Pickrel.....	111,452 06
Halibut ...	98,532 90
Sturgeon.....	88,899 60
Eels.....	84,714 80
Bass.....	75,573 30
Shad.....	74,058,41

GENERAL REMARKS.

Nova Scotia.

The returns show that the fisheries of this Province do not only maintain the improvement of the last few years, but they show a large increase over any former year. While this improvement embraces nearly all kinds of fish, it is most marked in cod, mackerel, herring, salmon and lobsters.

The encouragement offered by the bounty has largely increased the number of vessels and boats engaged in the deep-sea and shore fisheries.

New Brunswick.

From this Province the returns show a large increase in the yield of its fisheries.

A most gratifying feature is the general improvement in the salmon fishery, which extends to almost every district in which this fishery is pursued. Smelt herring and lobsters show increased catches. Shad and alewives also share in the general improvement, but the sturgeon fishery shows a large falling off from former years. In some districts the herring fishery was not so productive, while in others it shows a largely increased catch. This is no doubt due to the erratic movements of the schools of this fish, which, while never leaving our coast, change their habitat according to temperature, weather and the location of their favourite food.

Quebec.

The late date at which the ice left in the spring and the stormy weather which almost constantly prevailed in the Gulf during the fishing season, has caused a considerable decrease in the catch of almost all kinds of fish.

The decrease in the catch of salmon on the south shore of Gaspé and Bonaventure is, however, counterbalanced by the increased catch on the north shore.

More interest than usual was taken in the mackerel fishery and considerable outlay was made by local fishermen; but unfavourable weather doubtless affected the movements of the schools, which did not go to the west of Cape Breton, and the catch made was inconsiderable.

The inland fisheries show a large decrease as compared with the catch of 1883. This falling off, which was noticeable in almost every kind of fish, is due more to a prevalence of contrary winds and stormy weather than to any scarcity of fish.

Prince Edward Island.

The stormy and unfavourable weather which prevailed in the Gulf extended also to the Straits, and had the same effect on the Island fisheries.

The returns show a large falling off in all kinds of fish, the decrease being most marked in mackerel.

The single exception is the lobster fishery, which, contrary to general expectation, has been good, and the returns show a considerable increase over the very large catch of last year.

The enormous extent to which this fishery has been developed and the constantly increasing number of factories and fishermen have led to much confusion. It will soon be necessary, in the interest of the fishery, as well as of the fishermen and packers, to bring it under the more effective control of the Department.

British Columbia.

The returns from the above named Province show a large decrease in the salmon catch of the Fraser River, where only six canneries out of thirteen were in operation. This result was not due to any scarcity of fish, but to the large quantity of preserved salmon on the market and the low prices obtained.

A fish hatchery, measuring 100 x 40 feet, was built during last season on the Fraser River. It will easily accommodate 3,000,000 *Quinnat* salmon eggs, or 5,500,000 *Saw-quadi* salmon ova. By doubling the trays, double this number of eggs can be laid down. The catching of parent salmon began about the beginning of July, and by the close of the season 3,000,000 eggs were on the trays. The operations were highly successful and reflect credit upon the officer in charge, Mr. Thomas Mowat.

Ontario.

The total value of the fisheries in the Province of Ontario is reckoned at \$1,133,724.26.

On Lake Superior, Lake Huron and Georgian Bay, the individual catches did not much exceed those of last year, but the number of fishermen was larger and the aggregate yield consequently increased. The severe stormy weather which prevailed during the first part of November greatly interfered with the fishermen's operations, by damaging or destroying a large amount of twine and driving the runs of fish off the reefs; but, on the whole, the result was satisfactory.

Manitoba and the North-West Territories.

The dates hitherto determined upon as close seasons for whitefish in the Province of Manitoba and the North-West Territories having proved utterly inadequate, others will have to be substituted, so as to afford full and complete protection to this valuable fish during its breeding season.

An Inspector, Mr. Alex. McQueen, of Winnipeg, vested with magisterial powers, has been appointed, as well as a resident Fishery Overseer, Mr. F. C. Gilchrist, of Fort Qu'Appelle, for the Qu'Appelle district and vicinity. The system will be gradually extended as circumstances may demand, and other officers located at places where most needed.

Total		6,195
-------------	-------	-------

FISH-BREEDING.

Thirteen establishments for the artificial propagation of fish are now in actual operation in the several Provinces of the Dominion of Canada. These are at the present time largely filled with fish eggs, collected at various points during the spawning season of 1884.

The total number of young fish of various kinds hatched and distributed in 1884 amounted to 53,143,000, and the total quantity of fish eggs laid down in all the hatcheries during the fall of the same year was 66,033,000.

Mr. S. Wilmot's Report and other detailed statements connected with fish-breeding operations during the year 1884 will be found at Part II of the present Report.

FISHING BOUNTIES.

The total number of Bounty Claims received in 1883 was 13,604. Of this number, 523 were rejected for non-compliance with the requirements of the law and instructions. The total number paid during the above named year was 13,081; an increase of 1,109 over the year 1882.

The total amount of Bounties paid to vessels and boats was \$130,227.35.

The number of vessels claiming the Bounty was 902, with a tonnage of 34,549 tons, an increase of 116 vessels, with a tonnage of 6,938 tons, over 1882. This large increase is chiefly made up in the Province of Nova Scotia, and was the means of distributing among the owners and crews of that Province a sum of \$10,000 in excess of that of the previous year.

The number of boats which received the Bounty was 12,272, as against 11,225 in 1882; an increase of 1,047 boats.

Owing to the inadequacy of the grant, it was found impossible to continue the system of doubling the rate to boats, inaugurated in 1882, and the former rate of \$2.50 per man had to be adhered to.

Since the publication of the preliminary report the sum of \$117.50 has been paid on suspended claims for the year 1883, as follows :—

PROVINCE OF QUEBEC.

SAGUENAY COUNTY—VESSELS.

Official No.	Name of Vessel.	Port of Registry.	Tonnage.	Name of Owner.	Residence.	No. of Crew.	Amount of Bounty Paid.

Full details showing the amounts paid to vessels and boats in each Province are given at page 54 and following, of this report.

For the better information and guidance of fishermen claiming bounty for the year 1884, and others engaged in the transmission of claims and the distribution of the money, the following circular was distributed amongst claimants :—

FISHING BOUNTIES, 1884.

INSTRUCTIONS TO CLAIMANTS.

Boats.

1. Claimants to fishing bounty must have been engaged at least three months in seafishing, exclusive of salmon, shad, lobster and other fish and fisheries exempted from the operation of the Washington Treaty, and have caught not less than 2,500 pounds of seafish per man.

2. No bounty will be paid to boats measuring less than 14 feet keel, and no more than three men (the owner included) will be allowed as claimants in boat under 20 feet.

3. Dates and localities of fishing must be stated in the claim, as well as the quantity and kinds of seafish caught.

4. Ages of men must be given.

5. Returns must be sworn to as true and correct in all their particulars.

6. Only one claim will be allowed in each season, even though the claimant may have fished in two vessels, or in a vessel and a boat, or in two boats. Any person or persons detected making false returns will be debarred from participation in the bounty.

7. Claims must be filed on or before the 31st December.

8. Customs officers and fishery overseers will supply the requisite blanks, free of charge, and, after certifying the same, will transmit them to the Department of Fisheries.

Vessels.

9. Canadian registered vessels of 10 tons and upwards (up to 80 tons) which have been engaged during a period of three months in the catch of seafish not exempted under the Washington Treaty, are entitled to a bounty of \$2 per ton, one-half of which is payable to the owner or owners, and the other half to the crew.

10. Owners of vessels may, after the present season, and before proceeding on a fishing voyage, be required to procure a license from the nearest Collector of Customs, who will, subsequently, grant a certificate, stating that all the requirements of the statute have been complied with, and upon this certificate being filed with the claim, the bounty will be paid.

11. Directions contained in paragraphs 3, 4, 5, 6, 7 and 8 apply to vessels as well as to boats.

CONCLUSION.

The importance of the interests administered by this Department renders it imperative that, the fishery laws and regulations be enforced in a firm, though considerate, manner. In this connection, it might be mentioned that fishermen, as a rule, do not fully realize the importance of protective measures, and fail in many cases to support the Department in its endeavors to carry out a wise policy for the preservation of breeding fish, and the ultimate benefit of fishermen themselves. The above remarks apply with special force to the salmon and lobster fisheries.

I have the honour to be, Sir,

Your obedient servant,

JOHN TILTON,

Deputy Minister of Fisheries.

No. 2.

NOVA SCOTIA.

ANNUAL REPORT ON THE FISHERIES OF NOVA SCOTIA FOR THE
YEAR 1884, BY W. H. ROGERS, ESQ., INSPECTOR.

AMHERST, N.S., 31st December, 1884.

Hon. A. W. McLELAN,
Minister of Marine and Fisheries.

SIR,—In submitting my report on the fisheries of Nova Scotia for the year just closed, I am pleased to be able to point to encouraging evidence of future increase, as well as a very largely improved yield for the past over any preceding year since the confederation of the Provinces, if not in the entire history of Nova Scotia. Prominent among the causes of this encouraging growth of our fishing interests, I hope to be able to show the work of your Department in protecting and cultivating our inland or river fish, no less than the inducements held out to the people to engage in this profitable industry, in bounties and in offering every encouragement and aid in the improvement of fishing appliances. The mackerel trap, which was introduced in the Counties of Shelburne and Yarmouth about the year 1870, amid much opposition, is rapidly coming into general use, and its advantages are not only being seen in the increased catch of mackerel, but also in that of herring and other fish, and indirectly in the regular and abundant supply of bait to the line fishermen.

The entire crop for the present year, at the prices uniformly given in these returns, amounts to \$8,763,779.36, being an increase of \$1,074,404.61, or about 14 per cent. over the previous year. The profits of the business, in consequence of the small prices obtained and the dullness of the markets, have been small, and our fishermen on many parts of the coast have a gloomy winter before them. I do not, however, anticipate much actual suffering.

The increase is confined chiefly to the four items following:—

Mackerel, about.....	\$ 660,000
Cod “	270,000
Herring “	230,000
Lobsters “	70,000

These estimates include both Cape Breton and Nova Scotia proper. The river fisheries in both sections of the Province are rapidly improving, as the following facts and figures, the general accuracy of which I am prepared to say may fully be relied upon, will prove:—

SALMON.

This king of fish, regarding whose movements and prospects there has been much controversy for some few years past, is behaving just about as I have always contended it would, and is subject to the same general laws of atmosphere and weather which influence the movements of all other fish, and which affect adversely or otherwise their annual or periodical productiveness. That there has been an annual

decline in the quantity of these fish taken all along the northern coast of the Atlantic, from Hudson's Bay to Cape Hatteras, no man can deny, and, because of this decline, many persons have been very freely and dogmatically predicting a speedy annihilation of our salmon fishery, and point to certain local abuses as the cause, and that because the few millions of fry put into the streams, from two or three small hatcheries, have not only not prevented the ebb-tide in our salmon product but have not caused a great boom, fish-culture, as conducted in Canada, is a failure. With such views I have no sympathy. On the contrary, I am fully satisfied that all the visible results that any person, having any accurate knowledge of salmon fisheries in this or any other country could expect, are to be seen, at all events in some of the rivers of this Province. The difficulty with these people is that they have been expecting altogether too much without looking into the subject.

I claim that much has been done towards the increase in this fishery by the protection during the close season, and in the opening of the mill-dams for the easy ascent of the fish to their natural spawning grounds. I am ready to admit that the hatcheries have contributed their small percentage to the general improvement as above referred to, and I expect before many years, a much larger crop of salmon than has ever been taken in the Province.

The salmon crop of Nova Scotia and Cape Breton has been for the years—

	Lbs.
1880.....	383,550
1881.....	279,943
1882.....	580,061
1883.....	575,940
1884.....	730,984

So that we are clearly on the flood-tide of increase, which, I think, is likely to continue for some time yet, with probable slight annual fluctuations, caused, not so much by the scarcity or abundance of fish, but by the influence of the weather upon the modes of catching them.

The protection of the salmon fishery from the operations of the poacher, and the opening of the mill-dams as rapidly as possible for the easy ascent of the fish to their natural spawning beds, are essential, if a continued improvement is looked for. Artificial culture, properly and economically conducted, for the purpose of restocking rivers, entirely depleted of fish, as in the case of Wallace River, must, however, pay well in the end.

As the salmon have free water to ascend the rivers after the 15th August, with the exception of the hinderance offered by poachers, I do not think that the spring fishing legally conducted will materially exhaust the supply, because in this Province, at least, the great bulk of the spawning fish do not enter the rivers until the fall rains swell the streams.

I here reproduce a letter just received from James A. Tory, Esq., Overseer for Guysboro', as good an authority as there is in Nova Scotia in fishery matters, and he will be seen to corroborate my views as to the decline of the salmon fishery up to 1882:—

"In reply to yours of the 22nd inst., in reference to the catch of salmon, I can only speak of this County, but I have no doubt the same reasons are applicable to the other Counties. Formerly a considerable portion that appeared in the returns were taken on the coast of Labrador and Cape Breton, as well as on the shores of this county; but the fishery in the two former places has been totally given up, and to a large extent in the latter. • This will account for the falling off during the past ten years. The catch upon the coast will vary from year to year, and my experience is, that when the season for fishing is wet or the rivers high, the catch is short. This, to my mind, proves that the fish escape the nets by entering the rivers. Another reason is the nets are dirty and foul, so the fish will not mesh in them. The most of the catch is about the mouth of the rivers. I think the salmon are as plenty on the coast as they were ten years ago, only the facilities for catching are not so great."

Before dismissing this subject, I beg to say that in my opinion the penalties for illegal salmon fishing are not sufficiently heavy. Fines should be from, say \$30, upwards, with a term of imprisonment, and those killing salmon in a fishway should be given not less than twelve months imprisonment. This sort of vandalism is on the increase, and the worst feature of it is that the culprits receive, in too many cases, the countenance and moral support of respectable citizens, which emboldens them in their illegal and dishonest operations. I am very decided in the belief that these people will never be properly checked until the vice of the law is given another turn or two, that the sting may be the more painful.

ALEWIVES.

This branch of the fisheries maintains the large increase of the past four years. The average annual yield of the four years from 1876 to 1879, both inclusive, was 7,050 barrels, and of the last five years, from 1880 to 1884, both inclusive, was 20,000 barrels, nearly three times as much as the former; and yet, in the face of facts of this kind, there are those who assert that the river fisheries of Nova Scotia are rapidly declining. If the above fact is evidence of decline, the more of it the better. I venture to predict a still further increase in the immediate future. The following table will show the annual yield of this item since 1875:—

	Barrels.
1876.....	7,616
1877.....	5,443
1878.....	5,733
1879.....	9,409
1880.....	16,145
1881.....	22,474
1882.....	21,656
1883.....	18,346
1884.....	20,688

SHAD.

I am again, contrary to my expectations, compelled to report a still further decline in this branch of the fisheries, but I think we are now at the lowest and may, as in the alewife, salmon, and Digby herring fisheries, expect an annual increase for some years to come. During the four years, from 1870 to 1873, both inclusive, we caught 20,870 barrels; from 1874 to 1877, 25,732 barrels, and from 1878 to 1881, 34,650 barrels. The next four years will end with 1885, but as the past three have only realized 12,850 barrels, we will need to catch over 20,000 barrels the coming year to hold our own, and this I do not expect. Still the increase will come, particularly so as the Americans are very extensively cultivating these fish. It is my belief that shad move along the coast southwardly in the fall and enter the rivers of the southern States to spawn in the month of January, coming, as the fishermen of Florida affirm, from the north, while they enter the Bay of Fundy in the middle of June, coming from the south. If, as some persons hold, the Bay of Fundy shad fishery is the product of the St. John and other provincial rivers, the decline should be most marked in these rivers; but this does not seem to be the case, particularly with the St. John River, and I presume the people catch all they can while they are ascending the streams. According to the returns of shad taken in the St. John River Counties, there appears to be no decline, while the few which it is said escape the harbour weirs and go up the bay to feed must multiply marvellously on their short journey, because from ten to twelve thousand barrels per annum have been taken up the bay which do not enter the rivers there. Where do they come from, then, if not from rivers further south? The native shad are few in number in any of our rivers, and spawn early in the spring, coming down about the last of June and 1st of July, spent and unfit for food, while the bay shad are caught about the 15th and 20th June and are then quite fat.

The shad fishery is, however, pursued with much enterprise, and the natural source of supply is probably overtaxed, but I still think this will be fully met by artificial culture, so extensively conducted in the United States.

HERRING.

This fishery has given a largely increased crop. As stated in my last annual report, the annual average yield for the ten years, from 1869 to 1879, was 147,105 barrels, and for the four years, 1880 to 1883, 183,443 barrels, being an average increase of 36,338 per annum; but the catch of 1884 outstrips all past experience, amounting to 250,554 barrels, an increase of 65,111 barrels—35 per cent. over the average of the previous four years. The catch of

“DIGBY CHICKENS”

Continues to increase also. They have, during the past season, been more plentiful than for many years, and thus my expectations, often expressed in my reports and other correspondence with your Department, have been most effectually confirmed, in reply to predictions of impending ruin from local abuses. During the years previous to 1880, the annual yield averaged but 28,000 boxes, and during the years from 1880 to 1883, inclusive, 92,803 boxes. This year, we have a yield of no less than 112,785, and so great was the catch in some of the weirs that large numbers were used as manure; the people not being able to cure them before they spoiled.

COD.

This fishery shows an increase of 57,277 quintals over the previous year, but the markets have been very dull and prices have ruled low. Hence, the business, during the latter part of the season, was not pursued with as much energy as it otherwise would have been. The bounty annually paid the fishermen is stimulating enterprise, particularly in this branch of the fisheries. On the coast of Labrador the cod fishery was almost a total failure, and those of our own fishermen who went there came home empty-handed, while those who fished on the banks got two and three full fares. The catch along the shores of this Province was generally rather light.

MACKEREL.

Our returns this year show the largest crop of mackerel reported since 1871. This is what I confidently expected last year, when I advised the fishermen to have their mackerel gear ready and in good order as I was looking for a large run around our coasts during 1884. The yield amounts to no less than 156,000 barrels. The fish were generally small, however, and sold at low rates. Still the quantity taken was double the average of the three previous years, and the run will probably continue two or three years more; but these fish are so uncertain in their movements, that it is very difficult to establish any plausible theory regarding them.

LOBSTERS.

This fishery has been very productive, and 5,145,273 cans have been put up—an increase of 274,934—in addition to which, some 375 tons have been shipped to the United States alive and consumed fresh by the people. There is some difference of opinion as to the proper close time for lobsters. It is quite certain that, during five or six weeks in midsummer they are unfit for food, the time varying from two to three weeks, between the extreme east and west of the Province. I am of the opinion that a uniform close time of six or seven weeks, from the 20th of July to the end of August, or 25th July to the 5th of September, would be preferable to the present law. This would give those fishermen, on coasts obstructed with ice late in the

spring, an opportunity to fish some six or seven weeks in the fall months, when the fish are perfectly good.

BASS AND SMELT.

fisheries are annually increasing in importance, and regulations governing them are very necessary. I think those in force in New Brunswick should be extended to this Province. We had no little difficulty in controlling the fishermen at Tidnish, where an important bass fishery was discovered last winter. I have already called the attention of the Department to this subject.

FISH-WAYS.

The summer has been so continuously wet, and the streams in consequence so swollen, that nothing could be done until late in the season. Still, with Mr. J. B. Kinney's efficient aid, I have been able to construct seven new ladders, and to repair two or three others, so that we have now in the Province over twenty fish-ways on the model of the new patent, and all are working well. Many more are needed in the Province, and it is to be hoped a good number of these may be built next season. This is, without question, a most important part of our work, and its beneficial effect upon our river fisheries can hardly be over-estimated.

The cost of these structures is proving to be much less than I anticipated it would be at the time of their invention, and in this regard Mr. Kinney deserves the chief credit. He, and all others who are placed in a position to know, are becoming quite enthusiastic over the value, importance and effectiveness of the new ladder.

GENERAL REMARKS.

It will be observed that I have discussed the fisheries as including Cape Breton. This could not be well avoided when referring to the comparative yield of the various items with former years.

In regard to fish consumed fresh by the people, I have to say that instructions to Overseers, in pursuance of departmental suggestions, have been variously construed. It will be noticed by the returns that some have entered an estimate for home consumption in value, others more in detail, while others, and, to a certain extent, all have included all consumed by the people in their general figures. It is impossible to attain uniformity in this regard, and I confess that it must be a matter of the greatest difficulty for the Overseers to separate what is consumed by the people from that which enters into commerce. In some counties almost all the fish caught are used by the people where they are taken, and the officers have, as heretofore, entered the whole in the different columns. In my opinion it would be preferable, in many ways, to have all the fish, no matter where or how consumed, entered opposite their proper localities and in their respective columns in the returns, and to ask the overseers to make an estimate in their written reports of the proportion of the total catch used for home consumption. I may remark here that the increase in the general account of the fisheries for the year is not owing to any former omissions in accounting for what has been consumed fresh, as this has always been included by overseers in former years, as above suggested. Hence, all additions to our returns on account of this supposed omission are made in error. The increase for the present year fairly represents the improvement in the fisheries, and is not owing to inaccuracy in the statistics heretofore, a glance at the returns showing that the increase is confined almost entirely to the four items—mackerel, cod, herring and lobsters.

Abuses still exist, to a certain extent, in this Province, but have been so frequently referred to in former reports that a repetition here will be unnecessary. The tendency is strongly towards improvement, especially in districts in charge of active officers.

I append, as usual, synopses of the overseers' reports, which will be found interesting and useful. Many erroneous notions, so prevalent in the early part of our work, have been abandoned, and as our proper work is becoming better understood, the different officers are enabled to give much profitable information regarding the various branches of the fisheries. Nor can I close this report without again referring to the inadequacy of the remuneration these officers receive, and I would strongly urge the necessity of an increase in the scale of salaries paid the Nova Scotia fishery Overseers and Wardens.

I have the honor to be, Sir,

Your obedient servant,

W. H. ROGERS,

Inspector of Fisheries for Nova Scotia.

SYNOPSSES OF FISHERY OVERSEERS' REPORTS.

ANNAPOLIS COUNTY.

Overseer W. T. Carty, of Tupperville, reports that the hook fishing is gradually decreasing in the Bay of Fundy. The catch is largely made up by small vessels which frequent the mouth of the bay. The fishermen attribute the falling off to the great amount of trawling. Herring have been very plentiful on the coast of the Bay of Fundy, and in the Annapolis Basin. The fishermen have not been able to handle one-half of those caught; the Basin being fairly alive with them. Markets have, however, been so low, that great quantities still remain on hand, and those sent away have hardly paid expenses.

The fish-ways at Round Hill, Lequille, and Lawrencetown, are all in good working order. The Beals' dam at Nictaux has been down for two years, thus giving the fish a clear passage. It has been impossible to get a correct account of salmon taken at Round Hill. They have been very plentiful in the brook. There has been no fishing carried on in the Annapolis River; the late freshets having made it impossible.

ANTIGONISH COUNTY.

Overseer John McDonald, of Doctor's Brook, reports that a much larger amount of fish has been taken in Antigonish County this year than for many years past. This he attributes principally to the energy and perseverance of the fishermen along the shores; all the fish being caught in boats. The demand for fish has been good and prices have been on the increase. The fishermen are well satisfied with the system of licensing the salmon fishery, and Mr. McDonald finds that it keeps the best of order among them; quarreling and rowing for berths being unknown. Spring herring and alewives were more plentiful than for many years past, but the fishermen, not expecting them so abundantly, were not sufficiently prepared. He believes that the catch of mackerel, lobsters and hake would have been double the amount reported had the weather been less stormy. The lobster packers are generally well satisfied with the season's business. Overseer McDonald examined all the fish-ways in the County and found them in good repair, but as they do not do their work properly, he would ask the Department to have them rebuilt after the Rogers' model. Owing to the lateness of the fall freshets, it is feared that salmon and other fish did not, this year, reach their proper spawning grounds, and that in consequence a decrease may be looked for.

COLCHESTER COUNTY.

Overseer J. W. Davison, of Upper Economy, regrets to report a still further decrease in catch. It is difficult to explain the continued decrease, but Mr. Davison

† thinks that the wind and weather has had much to do with it, the past season being very unfavorable in this respect. He also thinks that between the large numbers of weirs set and of boats with long nets there has been a great deal of over-fishing. In opposition to the opinion of many of the fishermen, Mr. D. believes that these fish will again be as abundant as formerly. There always has been periodical fluctuations, and when there is a large run the number of persons who rush for them and the increase in the number of boats and weirs, the latter set on the flats, where the fish come to feed, are so great that it is not to be wondered at that there follows a decrease. While there are stringent laws for the protection of other fish, shad have been to a large extent entirely unprotected. Mr. Davison strongly recommends that there be a close season while shad are full of spawn, and believes that they should not be caught from 1st November to 15th June.

The close season for salmon has been generally well observed. There are known, however, to be poachers, with the most destructive means of killing fish known—dynamite—who are watching their chances.

There are six fish-ways on the old model in his district, which he hopes will soon be replaced by new ones.

Overseer Henry Blair, of North River, also regrets to report a greater scarcity of fish in the bay than usual. The catch on the whole, however, was fair. The run of shad early in the season was very good, but later it was much smaller, when the fishermen became discouraged and gave up. Afterwards, however, there was another good run, which was entirely lost.

Salmon came into the rivers in July, and have been going up ever since, but owing to the wetness of the season and the consequent great height of the river, the catch of both salmon and alewives has been small. The latter were abundant in the Shubenacadie.

Overseer R. J. Pollock, of Lower Stewiacke, attributes the small catch of shad on the Stewiacke River to the fact that it was impossible to set nets, owing to the height of the water.

Very few salmon came up this river until after the close season. From September to November they were very plentiful. All the fish caught in his district were used for home consumption.

Overseer Henderson Gass, of Tatamagouche, believes that the decreased catch of salmon in his district is owing to the extent to which this fishery is pursued further down the coast for canning purposes. He also believes that the clearing up of the country, in causing the soil to find its way into the rivers, destroys the spawn or prevent its maturity.

Mackerel were very plentiful in the bay during the summer, but so few people were prepared for them that the catch was small.

The only fish-way in his district, at the Balfour Mill, was thoroughly cleaned out in the fall, and is now in good order.

Mr. Gass recommends that an extension of the open season for salmon be made. They do not enter the rivers on that coast until about the 1st of October, when it is unlawful to catch them. He believes that were the people allowed to catch them for a short time after they enter the rivers, to stop poaching afterwards would be a matter of little difficulty.

All the fish caught in his district were consumed by the people.

DIGBY COUNTY.

Overseer William Hanley, of Digby, reports a decrease in the catch in his district, which he attributes to low prices in the markets, and the consequent non-prosecution of the business. Mackerel entered St. Mary's Bay in large quantities, and the people were so unprepared to cure them that large numbers had to be utilized as compost. From the most reliable authority to be obtained, Mr. Hanley finds that not less than 10,000 barrels were taken in seines by foreign vessels.

Herring were quite as plentiful as usual in the Basin, but not many were taken in the weirs. Very few shad were taken in the weirs in St. Mary's Bay during the past season. The weather has been very unfavorable for fishing. The Salmon River fish-way is in good condition. The county line trap has done well, though taken up before the mackerel entered the bay.

Overseer J. A. Collins, of Westport, attributes the decrease of this over the past year's catch, according to the returns, to the facts that the amount reported last year was excessive and that a large number of those heretofore engaged in line fishing this year followed the lobster business. There was a large catch of lobsters, and it is probable that in future this business will be much more largely followed. The catch of mackerel was also large, they being taken principally in St. Mary's Bay. As the head waters of this bay form spawning beds for mackerel and herring, Mr. Collins recommends that some measures be taken for their protection. During the past summer, large quantities of mackerel were allowed to die in the weirs along Digby neck and around St. Mary's Bay, caused by the negligence of the weir owners. The throwing overboard of fish gurry by American and other vessels is a great injury to the mackerel fishery and unless stopped it will destroy the fishing in St. Mary's Bay.

GUYSBORO' COUNTY.

Overseer James A. Tory, of Guysboro', reports that, although the amount of the season's catch has been about the same as that of 1883, owing to the decline in price of nearly all kinds of fish the business has not been nearly so profitable as last year. Owing to the myriads of squid which swarmed the coast and destroyed them as fast as they meshed in the nets, the catch of fall mackerel was, contrary to confident expectations, almost a total failure. The decrease may appear small, but is very important as to value. Were it not for the causes stated, the catch would doubtless have been far in excess of last year's catch.

The lobster fishery shows a deficiency of 64,200 lbs.. This falling off is severely felt by a class of persons unable to bear it, besides the general loss in a commercial point of view. The steady decline of the catch for several years past confirms the fears Mr. Tory has formerly expressed that the over-prosecution and want of efficient protection would ultimately destroy it. The decline in the hook and line fishery is attributed to low prices, which caused the withdrawal of some of the bankers from that fishery, and the shore or boat fishermen turning their attention to the net fishery. Otherwise, this branch of the fisheries would have exceeded former years, as fish were very plentiful.

The herring fishery has, in some portions of this district, far exceeded the catch of former years, and the excess will, to a certain extent, make up the loss on the short catch in other branches; but, at the same time, the low prices given for them has been a serious drawback.

Squid and other bait fish was in very little demand after the bankers were first supplied. Although very abundant during the latter part of the season, very few were taken.

The fishermen of Chedabucto Bay complain of the damage done their fishing gear by the American seiners, and with justice, as from forty to fifty sail could be seen at one time sailing to and fro through the nets, &c. for several weeks, and the fishermen say that whenever and wherever their gear came in the way of the Americans, who were casting their seines, it was "out knife and out away." Mr. Tory fears fatal results will follow a continuation of such acts, as the fishermen will not endure it. It calls for protection on the part of the Government.

Salmon and alewives entered the rivers in large quantities during the spring and fall, and owing to the height of the rivers they were unmolested, and an increase in these fisheries may be expected. Mr. Tory again urges the necessity for a small outlay for the purpose of clearing obstructions in the rivers and building proper fishways.

Overszer Allan McQuarrie, of Sherbrooke, reports a small decrease in the total catch in his district, and that owing to small prices many of the fishermen are sufferers. Fishing in the early part of the season was almost a total failure, but why it is difficult to state. The weather was dark and foggy, and what the fishermen term unfavorable winds prevailed. In the latter part of the season fish were abundant, but the low prices and the destruction of herring in the nets by squid caused a relaxation of effort. The catch of lobsters was an average one, but those of small size were very numerous. The catch of salmon was about the same as usual, but they have not been fished for so persistently as heretofore. The fine rivers of Guysboro' County and the inland lakes would afford excellent opportunities for the artificial culture of these fish; they could be bred to almost any extent, and would prove a great source of wealth to the county. The re-stocking of the lakes and rivers would be universally appreciated by the people.

Trout in the St. Mary's River were much more plentiful than of late years, and were of large size and excellent quality. Alewives and smelts could be largely increased by the removal of obstructions to their ascent of the rivers. Indian Harbour beach is in need of especial attention. The Country Harbour River, so famous for its salmon, trout and alewives, is so badly obstructed in the upper district with jams of driftwood and rubbish that fish cannot ascend to the beautiful clear lakes and sandy bottoms above.

The fish-way at Fisher's mills is a subject of much dispute among interested parties. The very best form is needed, and also a resident warden to guard it properly.

Mr. McQuarrie notified mill owners on the McKeen Brook to cease putting saw-dust in the stream, which has been fast filling up, to the great injury of the fish.

HALIFAX COUNTY.

Overseer Isaac Gaetz, of Musquodoboit Harbour, reports that the fishermen complained bitterly of the unpropitious character of the past season for the prosecution of their work. While there have been only a few storms that were very severe, and by which the fishermen lost many nets and other material, it has been rough enough almost continually to prevent fishing in small boats. The depression in the West India market for some time past has had a serious effect on the fishing interests, as prices have ruled very low. Mr. Gaetz states that he has taken all the pains possible to get accurate returns of the season's operations, and believes that the figures given are as nearly correct as possible. The salmon fishery has been about the same in extent as last year. There was a heavy freshet about the 1st of July, when the salmon were running, and a great many went up the rivers. Sea trout seemed to be more abundant than for some years past, but he regrets to have to report a falling off in alewives. He hopes, however, the decrease is only temporary, and has been assured from most reliable sources that multitudes of young fish went down the rivers. Mackerel have been more abundant this season than for some years past, and the fishermen say that, had the weather been favorable, they could have got all they wanted. The falling off in herring is owing entirely to storms that prevailed about the time they made their appearance on the coast. The cod fishery has not been a success on the Halifax coast this year, and were it not for the bounty that encourages the building and employment of vessels, there would have been a very light catch of cod to report. The fact that the lobster business has been so active that most of the fishermen have devoted their attention almost exclusively to it, until the canneries closed, accounts in part for the decrease in cod. There has been a large increase in canned lobsters. Nine factories have been in operation in Mr. Gaetz's district during the past year, and he believes that two or three new ones are to be erected for the coming season. He used his best endeavors to keep the rivers and streams unobstructed. There are a number of lawless creatures he has to deal with, who lie around all day and grumble about hard times, while they spend their nights, or a part of them, in poaching the rivers. Mr. Gaetz rebuilt the fish-way at Moser's

River, which was partly destroyed by freshets, and also made a small expenditure on Salmon River, in order to allow salmon, trout and other fish to get up. The sawdust trouble is making an appearance, notably at Sheet Harbour, but he cannot see that it injures the fisheries to any extent, with the exception of the annoyance it causes the fishermen by getting into their nets.

Overseer John Fitzgerald, of Portuguese Cove, reports that the catch of fish in his district is about the same as that of last year; that no abuses exist of which he is aware, and that the close season has been strictly observed. There are five fish-ways in his district, all of which have been kept open, and all are in fair working order. The fall fishing proved a total failure, owing to the prevailing high winds, which kept mackerel off shore.

HANTS COUNTY.

Overseer T. B. O'Brien, of Maitland, reports a slight decrease in the catch of salmon and shad, but an increase in other branches sufficient to make up for the decrease. More attention is being paid to the alewife fishery than heretofore. The shad caught this season were of the best quality and readily sold for nearly double the price at what they are rated in the returns. Squid have been very plentiful in the bay, but have proved most destructive to the shad after they had meshed in the nets. He believes that they will have a tendency to keep shad from the bay.

KING'S COUNTY.

Overseer R. F. Reid reports an increase in the alewives fishery in his district over that of several years past. Now that two new ladders, after the new model, have been placed in the Benjamin mill-dam, which appear to be all that can be desired in the way of a fish-pass, he has hopes there may continue to be an increase. He suggests, however, that a ladder be placed in the Dodge mill-dam near the lake, which would give the fish a free passage to their spawning grounds, they having now to go up a small brook to get to the lake.

Mr. Reid is pleased to state that there has been quite an improvement in the catch of salmon this season over that of the last, but he is unable to assign a cause for the increase in either alewives or salmon.

Overseer James S. Miller, of Canning, reports an almost total failure in the shad fishery in King's County for the past season, and also in the herring fishery of Medford. The cause of failure seems to be a scarcity of fish rather than a less vigorous prosecution of the fisheries. This does not prove that the fisheries in these places are becoming exhausted. Experience goes to show that there is a continual ebb and flow in the catch of fish in any given place, and there can be little doubt that the shad fishery will again prove a profitable industry in King's County.

LUNENBURG COUNTY.

Overseer George Redden, of Chester, reports that, since obstructions have been removed from Larder's River, the rivers in his district are in good order and there can be no difficulty in the fish ascending to their spawning grounds. There has been a marked increase in alewives this season; the amount caught being double that of last year. There has also been an increase in the catch of salmon, which Mr. Redden accounts for by the restocking of the rivers by the Department. He has had all the fish-ways in his district that were out of order repaired, and hopes to see the new ladder placed in Upper Gold River. The close time has been well observed, but the greatest difficulty is to prevent dipping in Gold River. Mr. Redden hopes that a regulation may be made forbidding it, as it is the source of great injury to the salmon fishery.

There has been a large increase in mackerel this season, but the fish have been of a poor quality. The increase is principally owing to the traps. The increase in

cod is owing to a more vigorous prosecution of that fishery. There has been a decrease in the catch of herring, owing to small prices obtained for them.

There are three small streams that alewives frequent, which should be cleared of obstructions, and were they properly opened, there would doubtless be a large increase in the alewife fishery in this district.

Overseer C. E. Goddard, of Bridgewater, reports that the catch of salmon in the LaHave River has been greater than in any year before, since his appointment. The water in the river was at times very high and, to the chagrin of the poachers, gave the salmon an excellent opportunity to pass the dams. The estimated catch of salmon from the mouth of the LaHave to Davison's lower dam was about 3,000 lbs. Mr. Goddard believes that a warden is very much needed there to assist him in his onerous duties. It is now impossible to get a local constable to arrest offending parties, but a warden would be expected to obey instructions of the Overseer, and poachers would no longer violate the law with impunity. During May he visited all the mills on the river and its tributaries, and notified the owners that they must prepare a proper place for depositing their sawdust and mill rubbish.

PICTOU COUNTY.

Overseer A. C. Pritchard, of New Glasgow, regrets to report that the run of salmon in the rivers of this district last season was exceptionally small. This he attributes to the unusual lateness of the freshets. During the ordinary spawning season there was not sufficient water in the river to admit of the passage of fish; consequently, when the freshets came but few made their way to the spawning grounds. Large schools lay for weeks in the basins at the head of the tidal waters, and it is generally believed they spawned there.

A quantity of fresh salmon was brought from the French River from time to time during last close season and sold at the Vale Colliery, and although Mr. Pritchard has made every effort to have the offending parties arrested he has been as yet unsuccessful.

The fish-ways on Middle and East Rivers have been well tested by the late freshets, and although logs and a quantity of other material were carried away, no damage was done. He would suggest that the old dam at Alma, Middle River, be destroyed or a fish-way put in there.

Overseer Robert Sutherland, of River John, says that he has taken every available means at his disposal to obtain correct accounts of all fish caught in his district. There has been no instance of illegal practises brought to his notice. He accounts for the scarcity of salmon from the fact that the dams are without fish-ways, and he hopes that efficient ones may be built there next season.

QUEEN'S COUNTY.

Overseer S. T. N. Sellon, of Liverpool, reports that the line fishery would be fully up to what it has been in the past, but that a different mode is necessary for a successful catch. Vessels fitted for the work are now being built, and the bounty is giving an impetus to further advance.

Labrador fishing has been a failure, not, says Mr. Sellon, because the fish are not there, but because our system is like the old Dutch plan—not up to the times. For want of bait, boat fishing has not been remunerative. Herring are as abundant as ever in deep water, but do not come into the bays and harbours as usual. They are a clean fish, and in his opinion keep outside of lobster pots, nets, ropes and the filthy garbage used for bait.

After lobster fishing was over, mackerel were abundant, and, although of small size, were of good quality. There can be no question that salmon have been on the increase. This must be patent to every one who will believe what they can see in the ladders, in the river, and in the lakes. The ladders are in good working order, and since they have been in use no salmon have been seen under the dams. They

serve as open doors for the fish to pass through on their way to the spawning grounds.

More alewives have been taken and more seen in our river than for many years. It is supposed that many went up when the freshet was high and too strong for dipping. A very great number of young alewives came down, and they were seen below the dams in the harbour and around the docks. The fishery law has been reasonably respected. Lobster fishing is an important and profitable business for many families all around the shores. No extension of time should be given this fishery on the southern shore of this Province. The Department saw fit several years ago to dispense with the services of a number of wardens for incompetency, and since that time Mr. Sellon has had to do the work, extending from the county line at Lunenburg to Shelburne. The fishery interest has increased in importance in the county, and a willing and interested warden is necessary to aid him in guarding the harbour and river at night. The great increase of American fishing vessels in the harbours requires extra vigilance, that they may be prevented from throwing garbage inside the line allowed.

Overseer John Fitzgerald, of Mill Village, reports an increase in the catch of sea-fish—herring, cod, and mackerel—also a small increase in the catch of salmon in the Medway River. The increase in the latter was in the upper reaches of the river, showing that the fish have an unobstructed course. There is good reason for the belief that the long period of easterly winds in April and May had the effect of diminishing the catch of salmon and alewives, and during their continuance scarcely any of either fish were caught, while the catch largely increased after the winds changed. The number of young fish which have come down the river is a gratifying proof that an increase may be looked for in the future. Smelts were very plentiful and sea trout, some of which were very large, are on the increase. There are no artificial fish-ways in any of the dams on the Medway. The mill-owners, as well as the rest of the people, appreciate the value of the fisheries, and vie with each other in efforts for their preservation. Some trouble has arisen between owners of adjoining properties on the Port Medway Harbour as to the rights of fishing berths; but, for the present, the disputes have been amicably settled.

SHELBURNE COUNTY.

Overseer William J. McGill, of Shelburne, reports about the same number of vessels engaged in the fisheries this year as last, but their trips show an increase of 10,181 quintals of cod. A number of fine schooners have been launched this fall, intended for bank fishing. The shore fishery has not been very productive, and many boats were unable to claim the bounty, not having taken the necessary quantity of fish. The reason assigned for the failure is the fact that squid have been unusually abundant, and their presence tends to keep other fish off shore. Lobsters were as plentiful as usual, and show no signs of exhaustion. An action was entered against one person for taking undersized lobsters, but failed owing to technical objections. Upon hearing of the issue of a second summons, the offender fled and has not since reappeared.

The catch of alewives compares favorably with that of other years, and an increase is reported in Roseway River. The new fishway has proved satisfactory, as a large number of both alewives and salmon were seen passing up. The early fall freshet gave the young alewives a favorable opportunity to return to the sea, and they were well protected. The fish-ways are in good repair, and Warden Holden reports salmon above the Jordan River dam.

Overseer E. S. Goudy, of Barrington, reports that four new vessels were added to the bank fishing fleet in his district during the past year. The bank fishermen returned with full fares, but the total catch of cod, in comparison with that of last year, is less, owing to the small catches in boats on the shore, and low prices offered. Both the mackerel and herring fisheries of the district show considerable improvement.

The new business of shipping lobsters to the United States alive has been carried on quite extensively, and has amounted to about \$14,761. The close season and the law respecting small lobsters have been well observed. Both packers and fishermen are well-satisfied with the present regulations, and desire nothing better.

The only fishway in this district—that at Clyde River—has been kept well opened and has given entire satisfaction. The catch of alewives shows an increase over that of last year.

YARMOUTH COUNTY.

Overseer Enos Gardner, of Tusket, says that the returns have been made from most careful enquiry at the different fishing districts, and are as nearly correct as possible. The amount for home consumption included in the return is about \$50,000. The bank and shore fishermen have all made extra large fares this year, and a much larger catch of cod has been made. The return of fish oil is also larger, and the new machinery used for extracting the oil has been found to be a great advantage. The prices for all kinds of fish have ruled low and, notwithstanding the large catch, matters are not so prosperous among fishermen as they have been the last two years.

In regard to river fisheries, alewives show a small increase. The high freshets prevented many from being taken, but they were then the better enabled to ascend to head waters. The young fish have come down in large numbers, and Mr. Gardner looks forward for a large increase in this fishery in the future. Salmon fishing was a little better than last year. The fish struck in early and were at first plentiful, but afterwards they became scarce, and there was not again a good run until June. The price was this season low, and the greater part was used for home consumption. In April last Mr. Wilmot brought some ova from the Bedford hatchery and put up a small hatchery, which he left in charge of Warden John A. Hatfield. The ova hatched out successfully and was distributed by the warden in the lakes. Should the artificial re-stocking of the rivers be continued, Mr. Gardner believes that in a few years the rivers of Yarmouth will be alive with salmon, as in former years. It would be a great advantage to have a permanent hatchery erected on the river. Last year the patent fish-way was put in at Carleton Mills and has given entire satisfaction. The fish ascend readily, and he has no doubt that in a few years the fish will be back in that river, as they were before the erection of the dam. Parties at Carleton say that quite a number of young fish came down in the fall. The new ladder put in at the gang mill, Kemptville, he inspected with Warden Hatfield shortly after it was finished, and it appeared to him to be thoroughly and substantially built, and, as the other, will no doubt give a good passage for fish. As the rivers are now comparatively free from obstructions, Mr. Gardner can see no reason why the fish should not largely increase.

The lobster fishing was prosecuted with energy and large quantities were taken. The prices for live lobsters in the United States was low and business was not, therefore, as profitable as in past years. The factories put up a much larger quantity than last year. The regulations were strictly observed throughout this county. It is the opinion of many intelligent fishermen, and Mr. Gardner agrees with them, that July and August should be a close time for lobster fishing, as a large proportion are soft and unfit for food.

The shingle machine owners at Carleton have kept their sawdust from drifting into the river, and burnt it. The other mills, however, still continue to allow it to drift in, and in time the lake will be filled, unless a stop is put to it. Of the four mackerel traps in this district, two were successful, the others not. The large catch of cod is, however, attributed to the traps, they giving a good supply of bait. The experiment of catching mackerel by a floating trap net was tried, but owing to the strong tides, proved unsuccessful.

Overseer George H. Robertson, of Yarmouth, reports that the past season has proved a good one for trap nets, nearly all having taken a fair quantity of mackerel.

Herrings were plentiful, but owing to the large number of what are called dog-fish, which destroy the nets, it was almost impossible to catch them. The net regulation has been generally well observed, but it will be difficult to enforce it unless a penalty is fixed in case of violation. Shad have been scarce, and the catch was much smaller than that of last year. The bank fishermen have all had full fares, but owing to low prices the business has not been very remunerative. Lobsters have been plentiful, and the close season has been well observed. If the fishermen were allowed to catch lobsters in the months of February and March it would be a great benefit to them and no injury to the fisheries. Lobsters caught in fall and spring are better for food and bring a higher price than those caught in July and August.

CUMBERLAND COUNTY.

Overseer Robert Goodwin, of Baie Verte, N. B., who has a portion of the above county under his charge, reports that after the ice left the bay, in April, herrings were quite plentiful and good catches were made. The ice, however, returned and carried away quite a number of nets. The catch was, on the whole, good, notwithstanding, and the quality of the fish excellent. Mackerel were plentiful and of good quality, but they are not fished for energetically. There is a small lobster factory in his district, which did a good business, and preparations are being made to extend this branch of the fisheries next year. A discovery of a bass fishery was made in Tidoish River last winter under peculiar circumstances. About the middle of January two nets were put in the river for smelts, when, much to the surprise of all, a large catch of bass was made—a thing never before known there. A large net was used and during two weeks it was with the greatest difficulty that wholesale slaughter was prevented. Over thirty tons of these valuable fish were taken in that small stream. They found ready sale in both Provinces, and many were shipped to Boston at good prices. As the season advanced, the bass seemed to move down stream and finally disappeared. The last were taken in March.

CAPE BRETON.

REPORT OF A. C. BERTRAM, ESQ., FISHERY OFFICER, ON THE FISHERIES OF CAPE BRETON ISLAND.

NORTH SYDNEY, C.B., 31st December, 1884.

Hon. A. W. McLELAN,
Minister of Marine and Fisheries.

SIR,—I have the honour to submit herewith the first annual report of the fisheries of the island of Cape Breton—embracing the four counties of Cape Breton, Richmond, Inverness and Victoria, as forming a distinct district from that of Nova Scotia proper—for the calendar year ending this date.

It will be observed, from the tabulated statements following, that the aggregate quantity and value of the fish caught on the coast and inland waters of the island, for the year 1884, exceed those for the year 1883. The increase in quantities of the leading branches prosecuted were: Salmon, over 35 per cent.; alewives, 90 per cent.; herring, 45 per cent.; codfish, about 4.25 per cent.; haddock, over 45 per cent.; and the total increase in the value of the catch of all kinds was \$153,612.

**COMPARATIVE STATEMENT of the product of the Fisheries in the Island of Cape Breton,
for the Years 1884 and 1883 respectively.**

Kinds of Fish.	Catch in 1884.	Catch in 1883.	Increase.	Decrease.
Salmon..... Lbs.	146,400	109,072	37,328	
Codfish..... Qnts.	133,609	128,109	5,500	
Haddock..... "	39,750	27,506	12,244	
Herring..... Brls.	57,263	39,418	17,845	
Alewives..... "	2,801	1,503	1,298	
Shad..... "	52	20	32	
Mackerel..... "	26,172	25,757	415	
Lobsters..... Cans	618,069	525,099	93,970	
Oysters..... Brls.	700	503	197	
Halibut..... Lbs.	21,060	16,870	4,190	
Bas..... "	400	700		300
Trout..... "	37,150	58,500		21,350
Smelts..... "	58,200	69,600		11,400
Eels..... Brls.	1,029			
Fish bait..... "	8,746			
Fish oil..... "	60,911			
Fish guano..... Tons.	77			

Of the increases above noted, the chief portions have been realized from the fisheries of the counties of Cape Breton and Richmond.

The total value of the fish product for 1884 was \$1,421,787, and the capital invested in vessels, boats, nets and all floating material, was \$5,325,390.

**GENERAL REMARKS ON THE SEVERAL FISHERIES—SEINE FISHING—
FISHING BY FOREIGNERS—TRANSPORT OF FISH—BRAS D'OR
LAKE FISHERIES, &c., &c.**

SALMON.

The marked increase in the catch of this fish, for the year 1884, whilst gratifying, is not owing to any circumstances, either extraordinary or accidental; on the contrary, for reasons hereinafter mentioned, there is good reason for believing that this most valuable branch of fishery will go on to develop into much larger proportions than at present for many successive years yet to come. One or two localities which experienced a falling off in the catch of the year owe the misfortune to merely temporary local causes, not likely to prove a permanent injury.

COD AND HADDOCK.

These continue to yield about 50 per cent. of the total yield, in value, of the fishery product of the island. This branch of fishery is very prolific on the Cape Breton coast, and with more energy than at present exercised by the resident fishermen, this invaluable industry is capable of a development manifold its present product.

HERRING.

The gratifying increase for the year just closed in the herring fishery over the product of the previous year, was profitable beyond the ordinary *pro rata* market

value of the increased quantity. The signal failure of this fishery on the coast of Labrador and adjacent shores gave rise to a demand for Cape Breton herring, in Montreal and other markets which used to be supplied from Labrador and the Newfoundland shores. This foothold in new markets is quite likely to be, to a certain extent, retained by the Cape Breton product, owing to its superior quality. The herring caught around the entire coast is of a superior quality, but there occurs "a run" of herring along the eastern coast, in the month of July, which for quality and size is said to be unequalled among all known herring fisheries. The remarks already made in reference to the possible further development of the cod and haddock fisheries apply with equal force to herring fishery, and if Cape Breton fishermen persevere in the care and honesty they have hitherto exercised in the curing, packing and grading of their herring, they are tolerably sure not only to retain the entrance they gained last year in new markets, but will also make their herring the most generally enquired after, wherever such are bought for local consumption.

ALEWIVES.

The quantity of this early spring fish actually caught is not fully represented in the foregoing table—much more being actually caught than is there represented. It is, indeed, impossible to obtain more than fairly approximate returns of the actual quantity caught, because, first, they are retailed to consumers directly out of the weirs, fresh, where taken, and after they ascend the streams considerable numbers are taken in small quantities not accounted for. Secondly, they are caught and purchased for the purposes of bait only, and are not salted down to any extent, except for export, not being so much in favor for domestic consumption as most of the other species referred to. They ascend the rivers from the sea in early spring, as soon as the ice moves from off the shores, frequently to long distances, before reaching the spawning resorts, where they remain unmolested until autumn, at which time they return seawards, in vast numbers, and although at this time unfit for food, serve an important use to the fishermen, by attracting landwards into bays and estuaries vast schools of mackerel which prey upon them.

SHAD.

The shad fishery has hitherto been almost entirely overlooked by Cape Breton fishermen, who seem to have regarded it as something that did not exist in sufficient quantity to warrant giving it special attention. A closer investigation shows this opinion to be utterly fallacious, and that this valuable and favorite fish does frequent certain localities in such numbers as to warrant a closer attention to the catching of it. This new branch of fishing will, doubtless, be henceforward stimulated into much greater activity than in the past, owing to the remunerative prices it readily commands. The increase in the catch for the year just closed, over that of the previous year, although but slight—20 barrels—is the more hopeful from the fact that Cape Breton County stands almost alone in any effort at an experiment in this direction, as of the 52 barrels enumerated in the preceding table, 47 barrels were secured in this county. The fact is now realized that this valuable fish visits the shores of this island in several localities and in large quantities, so that, owing to the superior inducements referred to, there is good reason for believing that the fishing of this species will, at no distant day, make an important addition to the general income derived from the fishing industry of the island.

MACKEREL.

The run of mackerel all around the coast was, in general, plentiful, and in some localities extraordinary in abundance. Notwithstanding this, the catch made by the fishermen resident on our own shores was not at all in proportion to what might have been expected from the general abundance of the fish; in fact, it fell short of the catch of some years in which mackerel were, apparently, much less abundant.

The shortage of this year was owing almost solely to a phenomenon long known to fishermen, viz., that there are times when these fish are met with in vast schools, yet will not take bait. Cape Breton fishermen, who prosecute this fishery mainly with hook and line, felt, this year, the full force of the phenomenal circumstance referred to, as it was widely characteristic of the mackerel fishery of the year, and the consequence has been a very much more diminished catch than might otherwise be reasonably expected.

The United States fishermen, who now prosecute this fishery chiefly by seining, derived the full advantage of the abundance of fish, and made large and remunerative catches on the shores of Cape Breton. This seining by the fishermen of the United States, which proved to them so prolific of rich fares, was prosecuted almost entirely inside the headlands and within the bays of the coast, i.e., the three-mile limits; yet it is a fact capable of proof that they had private instructions from home to report, on their arrival there, in their own ports, that their cargoes were taken entirely outside of the three-mile limit. Such an unworthy resort as this, to endeavor to mislead the public in reference to the value of our shore fisheries to them, would be almost incredible, was not the information derived from unmistakably reliable sources.

A circumstance very greatly enhancing the convenience and dispatch for the export of fish from the shores of this island has arisen within the last two years, and which has largely increased the length of time for which United States vessels can remain on the coast of Cape Breton during the fishing season, and thereby securing to them larger catches than they possibly could before. This will be referred to hereinafter, under the head of "Means of Export."

LOBSTERS.

The fishing and canning of lobsters is a branch of industry now assuming large proportions in the commerce of the island fisheries. The factories engaged in this business in Cape Breton are placed under serious disadvantages, on account of the date of the close season, as compared with similar industries on the south and western sea-boards of Nova Scotia proper. This comparative disadvantage arises from the late date of the spring season at which the drift ice is found on the eastern, northern and western shores of Cape Breton Island. This is the last coast which the ice, going down the Gulf of St. Lawrence and from the western part of the Straits of Belle Isle, touches upon in southern-bound course, before being caught by the Gulf stream, and sometimes it is found lingering on this coast as late as the 1st of June. Consequently, these waters are at so low a temperature that lobsters do not make their appearance near the shores until some time after the last ice has passed away, so that in the most favorable seasons there is no catch of this fish before the 1st of June, but frequently much later. The present legal period for lobster fishing is from the 1st of May to the 1st of August, which, however well adapted to the prevailing circumstances on the southern and western shores of Nova Scotia, where operations can be begun as early as the 1st of May, and where, from the earlier warming up of the waters, the lobster spawning season commences as early as the 1st of August, and the fish then becomes worthless, the later period at which lobsters appear or can be caught on the coast of Cape Breton, gives a correspondingly later date at which they are found in suitable condition for canning, and here they are found in prime condition on the 1st of August, when the present legal date for the close season commences. By the present uniform date for the close season extending to all the Provinces, the lobster canning around the coast of Cape Breton is deprived of a full month's less privilege than similar industries in other parts of the Province. I respectfully submit that the close season for lobster fishing might, with very much advantage to those engaged in the business, and with no injury to the fishing itself, be extended to, at least, the 21st of August, and I venture to recommend that the "close season" for the shores of Cape Breton Island be extended accordingly.

SEINE FISHING.

This injurious method of catching fish is monopolized almost entirely by the fishermen of the United States fishing on the coast of Cape Breton, and is strongly protested against by the resident fishermen on the coast, as being very destructive of fish. This is undoubtedly too true. By this method a school of fish is enclosed that would make, say, 200 barrels, if all taken in and cured, but instead of this the fish taken are culled, and all fish too small to furnish the required grade are thrown over into the sea again, dead, and the result is, that probably no more than 50 barrels are retained out of the 200 barrel bulk, thus killing 400 fish for every 100 preserved. This is an enormous waste of fish. The evil is further aggravated from this seining being done, almost solely, inside the headlands, within the calm waters of the bays and harbours, so that this quantity of dead fish, together with the offals cleaned from those retained, are thrown upon the bottom, thereby polluting the fishing grounds and, in consequence, the fish are scared away to seek purer waters and cleaner pastures. This, with the devastating destruction of young and undeveloped fish is an evil the effects of which are already alarming, but which will be felt more severely with the lapse of time, in the inevitable depletion of fish that must follow. This application of seining to codfish and mackerel—"trapping," as it is familiarly called—is a matter well worthy of some practical legislation, with a view to staying the evil.

THE COAST LINE OF CAPE BRETON IN RELATION TO FISHERIES.

The coast line surrounding the entire Island of Cape Breton is unsurpassed for the abundance, variety and excellent qualities of its fishery production, whilst one stretch of it, viz., that portion commencing with the harbour of Louisburg, on the south, thence around to the east, and northwards to Cape North, on Bay St. Lawrence, is pronounced, by parties having personal experience of fisheries on both sides of the Atlantic, to be unequalled in Europe or America. Not only do the varieties of fish most valued in commerce swarm around the headlands, but strike far inland to the head waters of the large bays and harbours for which this stretch of coast is physically remarkable. Besides this, there lie at short distances from the headlands, seawards, numerous banks, at all times prolific in the largest and heaviest varieties of fish most valued for export. It is only on this section of the coast that the large "July herring," referred to in the preceding remarks on the herring fishery, are found. Numerous indentations, forming coves, bays and harbours, extending far inland, give the island an extraordinary length of coast line in comparison with its area, and all these inland waters, without exception, abound in varieties of fish.

STREAMS.

The rivers of Cape Breton are somewhat numerous, but, as might be expected, comparatively small, with the exception of two—the Mira, on the south, and the Margaree, on the north, both of which are considerable rivers compared with the average of rivers in Nova Scotia. The Mira is classed as the second river in the Province, and abounds in fish throughout its entire length. It is in the large and beautiful estuary of this river, or rather Mira Bay, that the best shad fishing on the coast is found. Whilst it affords, in some parts, good angling, the Margaree is regarded as the angler's paradise for trout and salmon fishing. All the streams are visited by such fish as nature prompts to seek an annual change of residence from salt water to fresh. The fish visiting all these streams are very much less in number than at an earlier period, and those which have most declined, in other words, have come nearest to extinction, are the salmon and the large speckled sea-trout. The former of these is in a fair way of having its numbers amply restored, through the instrumentality of the fish hatchery. Thus far no artificial means have been called to aid recuperating the trout fisheries; hence the greater necessity for increased con-

tinuous vigilance against pot fishers and poachers, in their mischievous practice of netting and spearing this fish, as well as salmon, within the narrow precincts of the rivers, and after the fish have ascended to and settled in their favorite pools for spawning. It must be said that there is a growing intelligence among the people of most localities as to the necessity for abstaining from a wholesale and cruel slaughter of the parent fish in the spawning pools. One locality, however, yet occupies an unenviable notoriety in respect to wanton and illegal fishing by nets and spears.

In some cases there are partial obstructions to the ascent of fish, from mill-dams, and refuse from mills improperly thrown into the water. The latter is now the more special evil, inasmuch as fish are lovers of pure water, and they invariably forsake waters rendered disagreeable to them by the deposit of foreign matter, such as saw-dust, &c., &c.

Serious obstructions have occurred in a few streams from the torrent rush of the swollen waters in times of sudden freshets, by which trees, rocks, &c., are borne down, causing "jams" to form, of sufficient material to turn the stream aside from its original channel and force it over such places as form into bars and shoals. These are serious impediments and are immediately followed by a diminished catch in the net fishery of the estuary and its vicinity, of such varieties as were wont to ascend the stream. A small expenditure in removing these obstructions, so as to restore these streams to their original course, and in generally restoring the channels to their former depth, would, in a very short time, prove to be a profitable public investment.

FACILITIES FOR FISH TRANSPORT.

Hitherto our island fishermen have had no facilities for moving their fish to market, except by sea, and this had to be effected within the navigation season, and however much overstocked the markets might be, they were compelled to ship before the close of navigation. Within the last two years a partial relief to these compulsory conditions has come in, by a small ratio of their fish finding an opportunity of getting to market over the Eastern Extension Railway and thence over the Inter-colonial Railway. This relief, however, has been chiefly useful only by its enabling fish exporters to reach a given market or fill a direct order on time, without having to wait for shipping, not always available at short notice. But this benefit is, however, still dependent on navigation, as the fish has, in most cases, considerable distances for transport before reaching the railway terminus at Port Mulgrave, and can at present reach there by the aid of navigation only.

It is my desire, in this connection, to direct attention to the fact that the fishermen of the United States have thus far been the greater gainers by this new outlet. In the case of a vessel from a United States port fishing on the coast of Cape Breton or eastern Nova Scotia, when her fare is completed there may yet be a most valuable portion of the fishing season to lapse; but return home, to unload and deliver cargo, means the loss, probably, of the whole of the remainder of the fishing season. Particularly is this the case with the fall mackerel fishery. Hence, the masters and owners of these vessels have found that it is very much better to unload at the railway terminus of Port Mulgrave and forward their fish by rail, home to the United States, as another full fare is likely to be secured within the time that it would take such vessels to make the voyage home to Gloucester, Portland or Boston, unload and return to the fishing grounds. Thus by connecting with the railway at Mulgrave station, or the Boston weekly line of steamers calling at Port Hawkesbury, the value of our fisheries is tripled to United States fishermen, as compared with the late necessity making the run home to discharge cargo. That this is likely to be very largely utilized by them is confirmed by the following statement, showing the vast increase by railway carriage of fish over the Eastern Extension in 1884, compared within 1883 which may be called the initiative year of this system.

STATEMENT of fish forwarded *viâ* the Eastern Extension Railway, from Mulgrave Station to United States and Markets of Canada, for 1883 and 1884.

	To United States Ports.		To points in Canada.	
	1883.	1884.	1883.	1884.
Pickled fish..... Brls.	510	13,762	1,250	6,553
Salmon, frozen, in boxes Tons.	10	20		
Dried fish, in bundles and boxes..... “		20		30

The Boston line of steamers which calls weekly at Port Hawkesbury carry very much more of this freight to Boston, &c., than is forwarded by railway. I applied to the agent for this steamship line at Port Hawkesbury, but could not obtain the figures; but, from observation, the quantity is known to be in excess of that shipped at Mulgrave station. In the above table the quantities sent “to United States ports” consist entirely of fish forwarded “home” by United States fishing vessels. That indicated “to points in Canada” are the quantities forwarded by our own fishermen.

BRAS D’OR LAKE FISHERIES.

The important inland sea designated as the Great Bras d’Or Lake, intersecting Cape Breton Island from end to end, with its numerous bays and inlets, forms a large and important fishing area. Its waters abound, at all seasons, with cod, herring, trout, smelt and eels, which make these waters their permanent home. Besides these, it is visited by migrations of mackerel and salmon in summer and autumn. This arm of the ocean being so closely land-locked, very little drift ice finds its way in, and then only for very short distances. The great value of this fishing ground lies in the exceptional fact that the fish named, which reside in it permanently, is that all of these species are found present in their prime condition in the winter season, and are caught to any desired extent through the smooth native ice, although, as yet, no more are sought after than can find ready sale in the home consumption of the island; a market too limited to develop this fishery into a large trade.

When, however, the contemplated railway from the Strait of Canso to Sydney or Louisburg will, as expected, pass along the line of a considerable portion of this lake shore, it cannot fail to develop an immense trade in frozen fish for the supply of western Canada as well as to markets in the United States.

Annexed hereto are the tabulated returns from the several fishery overseers on the Island of Cape Breton, which show the extent of the fisheries, kinds, value, &c., &c., for the respective districts, in detail.

I have the honor to be, Sir,

Your obedient servant,

A. C. BERTRAM,

Fishery Officer for Cape Breton.

SYNOPSIS OF FISHERY OVERSEERS' REPORTS.

COUNTY OF CAPE BRETON.

Overseer Francis Quinan, of Sydney, reports an increase in the catch of salmon, alewives, shad, halibut and oysters, in his district. Had the people been prepared for the shad and alewives, the catch would have been much larger, as those kinds of fish had not frequented, in any great numbers, his district in former years. Their appearance this season in large numbers took the fishermen by surprise, and found them unprepared. Herring were very scarce. There is a good deal of superstition amongst fishermen in consequence of the non-appearance of herring on our coast during the last two years, but this is owing to the fact that those fish are intercepted on their way to our coast, and those that reach our shores are now pursued by over double the number of boats and vessels that were in the business a few years ago. In this district there is but one fish-ladder, which is located at Grand Lake. It is a good ladder and has served its purpose well since it was placed in that river, five years ago. Some of the rivers in his district are filling up with *debris* caused by heavy fall and spring freshets, and he recommends that a sum of money be expended in cleaning the principal rivers.

Overseer Alexander McDonald, of East Bay, reports an increase in the catch of codfish and mackerel in his district over that of last year. Codfish were very plentiful during the season, and considerable more could have been caught were it not for the scarcity of bait. The fishermen depend chiefly on capelin for bait during the month of July, as it is the best bait they can use during that month. Capelin, however, did not approach the shores in such large quantities as formerly, and, as a consequence, the scarcity was much felt by fishermen. He regrets to report a large falling off in the catch of herring in his district. Many of the fishermen fitted out extensively for the latter fishery, but did comparatively nothing. The catch of salmon is about the same as last year. There is not as many people engaged in the salmon fishery in his district as formerly, owing to the scarcity of these fish of late years. Fishermen, as a general thing, now give more attention to the prosecution of the cod and mackerel fishery, as they find the latter to be more remunerative than the former. He reports an increase in the catch of alewives in his district. Lobsters were very plentiful during the season, and the two canning factories in his district did well. There is now a new lobster factory in course of erection, and will be ready for operation next spring. There were no violation of the law in his district during the year.

Overseer Y. A. W. Barrington, of Sydney Mines, reports an increase in the catch of cod in his district, and a slight falling off in the catch of herring. He reports the halibut fishery a failure, and cannot give any practical reason for the scarcity of these fish. The catch of salmon was much larger than last year. The first lobster factory in his district began operations last season, and was quite successful. Owing to drift ice, canning cannot commence before the second week in May, which makes the season very short. He recommends an extension of the close season.

INVERNESS COUNTY.

Overseer D. F. McLean, of Port Hood, reports an increase in the following branches of the fisheries in the district under his supervision during the year closed, viz :—Salmon, herring, eels and oysters, and a decrease in the following branches, viz :—Mackerel, codfish, alewives, hake, haddock, trout and smelts, making a total decrease in the value of our fisheries of \$25,061.80, as compared with the year 1883. The cause which led to the falling off in the different branches of the fishery named are unaccountable, even to the most scientific enquirer. For instance, fishermen and fish dealers in this district contend that codfish was as abundant as last year on the coast, but they would not take bait. The same assertion is made in reference to mackerel. The prosecution of the fishery was fully as vigorous as during the past and preceding years, but prices were less remunerative.

The principal abuse which exists on our shores is fishing mackerel and herring with seines. This mode of fishing proves very injurious to our fisheries, and in consequence thereof a large number of young fish is destroyed every year by vessels which frequent this coast for the purpose of catching fish in no other manner than with seines. He strongly recommends that a law be enacted to prevent this abuse in future; otherwise, in a few years our mackerel fishery particularly will be completely exhausted. The close season has been well observed in this division of Inverness County. The total value of the fisheries in the various districts stated in the annual report herewith, according to the most reliable statistics which he could obtain, amounts to \$217,945.45. Of this amount he has valued the quantity entered for home consumption at \$36,500. The lobster fishery was about the same as last year, the returns showing a very slight decrease. The lobster canning establishment on Port Hood island was opened on the 19th day of May and closed on the 11th day of August, and the one at Mabou Harbour commenced operations on the 24th day of May and closed on the 23rd day of July, 1884. In the former 44 hands were employed, besides fishermen; 32 boats and 4,000 traps were used—and 106,372 one-pound cans were put up. The price paid for lobsters was 55 cents for 100 lbs. At the latter (Mabou Harbor) 28 hands were employed, besides fishermen; 13 boats and 1,600 traps were used, and 34,147 one-pound cans put up. The price paid was 50 cents for 100 lobsters. All right-thinking men concur in the opinion that the fishing bounty granted by the Government of the Dominion is a wise and just provision, and it is to be hoped that, in the interest of the fishermen of the Maritime Provinces, the grant will be continued from year to year. The beneficial results of the money so paid are noticeable in every fishing community.

Overseer James Coady, of South-West Margaree, reports that his statistics show a decrease, compared with that of last year, chiefly due to a large falling off in the catch of cod and haddock. This he attributes to two causes—first, not being so vigorously prosecuted on account of the small price obtained; secondly, the weather being unusually stormy, fishermen had not as much success in prosecuting their avocations, yet they all admit that fish were plentiful on the coast.

There is a small falling off in the catch of mackerel, while herring show an increase over last year of 500 barrels. Salmon fishing on the coast was the best for the past ten years, but these fish were scarce in the river the first part of the season; afterwards they came in the rivers very plentiful. From the last of July to the first of November the rivers were well stocked with fish. There is an increase of over 1,000 barrels in the catch of alewives; trout also have been very plentiful. Poaching is yet practised to a small extent. We had much trouble the first part of the close season with a gang of masked poachers, but finally succeeded in taking and destroying some of their boats. This prevented further poaching during the season. The value of fish used for home consumption is estimated at \$18,250.

Overseer David Ross, of North-East Margaree, reports that the general catch of fish for his district is below the average, owing to the unfavourable state of the weather, especially during the latter part of the season. The catch of herring during the month of September was unusually large, surpassing that for a number of years. The close season was strictly observed. The salmon spawning grounds were never more frequented by the parent fish. There were 210 salmon taken from the Margaree River for spawning purposes for the Sydney hatchery. The parent fish were afterwards returned to their native element. The value of fish used for home consumption is estimated at \$28,000.

RICHMOND COUNTY.

Overseer D. Cameron, of St. Peter's, reports in his district a very decided improvement this year over that of last year, there being a large increase in the catch of every kind of fish caught on this shore—the fishing of cod, haddock and herring being attended with remarkably good results, the catch being nearly double that of

last year. The following is a comparative statement of the yield of fish in his division for the year 1883 and 1884 :

Kinds of Fish.		1883.	1884.	Increase.
Salmon.....	Bbls	25	37	12
Mackerel.....	"	4,948	6,511	1,563
Herring.....	"	3,877	8,843	4,966
Alewives.....	"	53	111	58
Codfish.....	Cwt	10,907	14,803	3,896
Haddock.....	"	3,153	14,700	11,547
Lobster cans.....	"	62,000	78,000	16,000

Large as is the quantity of fish caught this year over that of last year, it would have been much larger had it not been for the roughness of the weather during a part of the fishing season, as gales of wind were so successive that fishermen were unable for many days to go to the fishing grounds. Fish have been very plentiful this season, and the fishing bounty has stimulated fishermen to greater exertion and perseverance in their occupation; hence the large catch. The number of lobster cans would have been greater, had it not been that the supply was poor, owing to the prevalence of high winds during a part of the season. He has no abuses to report, as the law has been strictly complied with. Fair prices have been realized for pickled fish; and although prices for dry cod have been low, yet the large increase in quantity more than makes up for the low prices. Fishermen in this district have never been in better circumstances than they are this year.

Overseer Francis Marneau, of Arichat, reports a most prosperous season for fishermen generally, and a decided improvement over last year in the catch of the principal fish. A most gratifying increase is shown in the catch of codfish and herring. He thinks that the fisheries in his district will be prosecuted more vigorously next season than any previous year, as a large number of nets are being made and boats built for next season's operations. The fishing bounty given to the fishermen by the present Government proves a valuable boon to fishermen; and he attributes the increased energy now being put forward in his district to the bounty. The fishery laws have been so well observed, that he has no violation to report.

VICTORIA COUNTY.

Overseer D. McRae, of Baddeck, is pleased to report an increase over last year's catch of all kinds of fish in his district. Herring were very plentiful during the month of July. About the first of August codfish were in great abundance, and the fishermen did well. The bounty had the effect of stimulating the fishermen on to the more vigorous prosecution of their calling. He reports that the rivers in his district have been carefully protected, although there was a disposition, on the part of certain parties to violate the law.

Overseer Malcolm McIntosh, of Aspy Bay, reports an increase in his district of 2,000 quintals of codfish over the catch of last year. The catch of salmon doubled that of 1883. The herring catch exceeded that of last year, but the catch of mackerel was smaller. Fishermen are of the opinion that both the herring and salmon fishery are ruled by prevailing summer winds. Fishermen also contend that mackerel have been driven off the coast by American seiners in the months of August, September and October. The season was very boisterous in comparison with former years; nevertheless, the fishermen did fairly well. The season for lobster canning is too short, as the drift of ice which blocks the coast until the middle of May prevents the catching of lobsters before that date. The close season was well observed throughout the district. Two new fish-ways were erected on Middle Harbour River, where two new grist mills are in operation. The dispute which arose in the early part of the season between local fishermen and seining crews was settled, and since peace and quietness prevail.

No. 3.

NEW BRUNSWICK.

ST. JOHN, 31st December, 1884.

Hon. A. W. McLELAN,
Minister of Marine and Fisheries, Ottawa:

SIR,—I have the honor to submit a report on the fisheries of New Brunswick for the year 1884, with synopses of the reports from local overseers. Appended to these are returns of the catch in the several districts, in each county, and in the Province. In the aggregate these returns show a considerable increase over the catch of last year.

SALMON.

The returns show an improved catch of salmon in almost all districts except Ristigouche. In this district the decrease is very considerable, not only on the coast, but in the estuary and up the river. Nor has this falling off been confined to net fishing alone, the angling catch having been less than half that of last year. To those who have watched our salmon fisheries for the last twenty years, there is nothing surprising in this decrease. On the contrary, the signs of exhaustion have been apparent for a long time, and the results now seen are only such as the agencies that have been at work would naturally produce. In 1874, the catch in the Ristigouche district was 678,500 lbs. In 1884 it was 171,305 lbs.—a decrease of 507,195 lbs., while more men were employed, more nets were in use, and greatly improved modes of setting them. In Miramichi the catch has been better than last year, owing, no doubt, to very favourable weather for fishing; but still the same steady decrease is seen in this district. In 1874 the catch was 1,323,798 lbs. In 1884 it was 371,370—a decrease of 952,428 lbs. In Gloucester district there has been a great improvement on the poor catches of the last four years, but in this county, also, the steady decline of the fishery cannot be ignored. In the whole Province the catch of 1874 was 3,214,182 lbs. In 1884 it was 1,110,745 lbs.—showing a decrease in ten years of 2,103,437 lbs.—nearly two-thirds—while the number of men and nets employed in the fishery has nearly doubled. The causes that have led to this serious decline, and which now threaten the extinction of the salmon fishery as a profitable industry in New Brunswick, are not far to seek. They are: Excessive fishing in the open season, and the destruction of spawning fish in the close season. On the Miramichi the state of things described by Overseers Bamford and Freeze (see synopses) is not exaggerated. I have for years called attention to these abuses, and urged more vigorous measures for their suppression. The means at present employed for the protection of salmon on the upper waters of our rivers, and on their spawning beds, are wholly inadequate. The officers are too few for the work, and the pay insufficient to secure good and faithful men. Until these causes of depression are removed, it will be vain to look for any permanent improvement in the fishery.

BASS.

There has been no falling off in the yield of this fishery; the catch is about the same as last year. But this result has been caused more by the greater attention given to this fishery than by any increase in the stock. The number of small fish,

of which the bulk of the catch consists, shows that the fishery is not likely to improve; while the large number of very small bass caught in smelt nets cannot fail to have a bad effect upon the yield of future years. In Northumberland and Kent the utmost efforts of the officers are ineffectual to prevent the export of illegal fish. So long as an outlet can be found for undersized fish and fish caught out of season, poachers will catch, and dealers will buy and ship, despite the utmost vigilance of the fishery officers. In special reports I have pointed out a simple and effectual remedy for this, and I would again respectfully urge its adoption, even if further legislation is necessary to secure it. I cannot recommend any relaxation in the regulations now in force. If the present excessive fishing could be curtailed, the best results would follow.

SHAD.

The returns show a slight improvement in this fishery, as compared with last year, but there is no doubt that it is steadily decreasing in this Province. There has been some discussion in the press of Nova Scotia as to the birth place of the shad which are caught in the Bay of Fundy. Some of the disputants contend that the shad does not spawn in any of the Nova Scotia rivers; that they come from the southern rivers, along the American coast, and that greater numbers of these may be annually expected in our waters, in consequence of the vast increase caused by artificial hatching now largely pursued by the United States Commissioners of Fisheries. As to the first part of this contention, I may say that, as a matter of fact, shad do spawn in at least two Nova Scotia rivers—the Shubenacadie and the Stewiacke. As to the second part, if true, it is somewhat strange that, while shad are increasing vastly in these southern rivers and still more vastly in some of the northern rivers, they are decreasing in the Bay of Fundy. In 1882 they were very plentiful in American waters, while the catch in the Bay of Fundy waters was very small, both in Nova Scotia and New Brunswick; the whole catch in the former Province having been only 3,442 barrels, being little over one-third of what the annual catches were before they received any assistance from artificial culture. *These are the facts;* but some theorists care little for these when riding their hobbies.

ALEWIVES.

A very considerable increase in the catch of this fish is shown by the returns. Favourable weather everywhere during the fishing season will explain this improvement. In St. John harbour and river the weather and the freshets were exceptionally favorable for this fishery, and the catch largely exceeds that of last year. The numbers left to spawn must necessarily have been small, and future years cannot fail to show the effects of this year's over-fishing. As stated in former reports, I see no reasonable prospect of this fishery permanently improving, unless more protection is given to parent fish. The whole annual catch consists of gravid fish seeking their spawning places, and enough of these to keep up the stock do not reach them under the present mode of fishing.

SMELT.

The extent to which this fishery has increased is something wonderful. The fish abound in all the northern rivers, and every year adds to the number of nets and fishermen. The yield steadily increases because new localities are opened up and additional fishermen add their catch to the general supply. The returns show an increase of 2,000,000 lbs. over those of last year. A few years only have elapsed since the export of this fish was commenced. The catch has gradually increased, until the returns now show 5,801,560 lbs., valued at \$348,093. New markets are being found and the gluts that formerly kept prices so low that no profit was made are now avoided. The business is better conducted, the fish better handled, better culled and better packed, with more satisfactory results to all concerned. Evidence

is not wanting to show that the enormous annual drain on the supply is being felt. Large fish are becoming scarcer and the average size becoming less. While the aggregate catch increases in consequence of more men and more nets being employed, individual catches are growing less, and more labour is required to secure them. The usual results of over-fishing will, no doubt, soon become more evident. Were fishing restricted from 1st December to 15th February, much loss from soft weather would be avoided, and both fishermen and shippers would find it to their advantage—the former in enhanced prices, the latter in better profits.

PICKEREL AND PERCH.

The demand for these fish has been good this year, and much larger catches of each have been made. The catch of pickerel last year was only 34,000 lbs.; this year it has reached 130,570 lbs. Perch have increased from 10,450 to 12,000 lbs. The home demand for each has somewhat increased, but the bulk of the catch has been sent to American markets. While both these fish are plentiful in many of our rivers, fishing for export is confined entirely to the St. John River and its tributaries.

TROUT.

All our rivers, lakes and streams abound in trout, but few are caught for market, and still fewer exported. Their capture, being confined to hook and line, is followed more for sport than profit. The abundance of this fish in our waters attracts sportsmen from all quarters, and the money spent in their pursuit far exceeds their value as food. While some illegal fishing is, no doubt, done, the close season is fairly well observed, and it is an encouraging sign to see sportsmen advocating a large extension of close time, so as to put a stop to winter fishing, when fish are in poor condition. If their wishes were granted, and the close season made to extend from 1st October to 1st May, no doubt the fish would rapidly increase in those waters where over-fishing has shown its usual results.

STURGEON.

The great decrease in the catch of this fish which I have had to report for several years past has, this year, been still more marked. The catch is not more than half that of last year, which showed an equal decrease, as compared with the year preceding. Those engaged in the business have hitherto attributed this falling off to high freshets and unfavourable weather; but the experience of this year points to a different solution of the trouble. The opinion expressed in my last report would seem to be borne out by the result of this season's fishing. I never believed the stock in the river would stand the excessive fishing which followed the commencement of the business, still there were some peculiarities in this season's experience, which are not easily explained, in my present knowledge of the habits of this fish. The principal of these is the fact that very few small fish were taken; most of the season's catch consisted of large fish, and it would seem as if the smaller fish were not in the river. Why they did not come as formerly I am at a loss to explain, and I have little faith in theories unsupported by facts. The most marked feature in a failing fishery is the scarcity of large fish and the preponderance of small ones. But this rule seems to have been reversed this year, and though the numbers taken have diminished, the size has increased. I am informed that a movement is on foot to obtain the removal of the tax on nets, on the ground that fishing is so poor. From my point of view, this is the strongest reason for continuing it; for no hope of improvement can reasonably be entertained until the excessive fishing that has hitherto been pursued is much reduced. But as past experience has shown that this fishery cannot be commenced earlier than the second week in June, in consequence of spring freshets, which do not subside much earlier than that date, the fishing season might be extended to the 15th September, without injury, as it is now pretty certain that this fish spawns all through the summer months.

HERRING.

The returns show a considerable increase over those of last year, both in salted and smoked; but a decrease in sardines and frozen herring. The demand for small herring was not so brisk among the sardine factories, and prices declined. In Grand Manan large catches of fine fish are now being made, and the prospect for a good winter's fishing is cheering. The recent Orders in Council for the protection of spawning grounds and for the prevention of "torching" or "driving" herring, will have a most beneficial effect upon the future of this valuable fishery.

MACKEREL.

There is an increase in the catch of salted mackerel, but the quantity canned is far short of last year's returns. It is hard to understand how our fishermen can see American vessels successfully pursuing this fishery, "with all modern improvements" under their very noses, and not desire to share their profits. But, strange as it may appear, our fishermen have neither suitable vessels to follow the "schools" of fish, nor suitable seines to capture them. Not a season passes but these fish are more or less plentiful on our northern coasts, and particularly in Bay Chaleur, where they are seldom absent during the summer. But our fishermen and fish dealers content themselves with the old and inconvenient shore boat, and with the primitive "mackerel jig," and when the fish will not take bait, they put in the time grumbling at the "Yankeys," who are "destroying the fishing" by means of improved nets and a liberal use of enticing bait, instead of profiting by their example and using the same means. On the coast of Gloucester two traps were under license this season, and did very well, but success in this mode of taking mackerel is very uncertain, depending entirely upon the erratic movement of the schools, which only by chance come near enough to shore to enable the traps to capture them.

COD.

There is a considerable decrease in the catch of this fish, caused entirely by the want of enterprise in its pursuit. In Charlotte County the demand for sardine herring has given employment to those who formerly made codfishing their principal business, and in the northern counties the "lobster craze" has almost entirely drawn the cod-fisherman from his old employment. While these inshore fisheries furnish remunerative industry to fishermen, nearer to their homes, no extension of deep sea fishing can be expected.

HALIBUT.

The returns show a large increase in the catch of this fish, which has been very plentiful in our waters this year. But little of this fish is salted; the great bulk of the catch finds ready sale fresh in home and American markets. When successful this fishery is very remunerative to those who engage in it. After being caught the halibut requires no labor, and is always sure of a ready sale; but the fishery is precarious, and success does not always reward the most persevering industry.

HADDOCK.

The catch of this fish falls below that of last year. This is not to be attributed to any scarcity or failure in the supply; but entirely to the limited number of men employed in its capture. Herring fishing in the southern counties and lobster fishing in the northern counties have led to the neglect of this fishery, which takes men from their homes and demands more labor and exposure.

POLLOCK AND HAKE.

In pollock there has been an increase, but in hake a decrease, as compared with last year's catch. Formerly these fisheries were the principal employment of the

whole fishing population of Charlotte County; but they have, of late years, been almost deserted for the easier and more exciting business of weir fishing for sardine herrings.

LOBSTERS.

While the stock of lobsters on our shores has been steadily decreasing for years, the number of factories has been increasing. Consequently, we have seen, this year, the strange and almost incredible anomaly of a failing supply furnishing an increased yield. The returns show 5,662,072 cans of preserved and 1,709 tons of fresh lobsters, being an increase of 1,619,118 cans, and 784 tons over the catch of last year. Not only is the supply growing less, but the average size of the lobster is diminishing, and has now fallen below the standard of nine inches in length. Of this size it takes five fish to fill a pound can. To furnish the above quantity of canned goods, 18,310,350 lobsters have been killed this year. If to this we add the number disposed of fresh—1,709 tons—at the rate of 2 lbs. per fish, which is a very large average, we shall have, as the year's destruction, 20,019,350 lobsters. No one knows better than the cannery themselves the inevitable result of this annual drain on the supply. But, careless of this, they are seeking to have the present insufficient restrictions removed, in order that they may still further increase the production of canned goods, in the hope of making a larger supply compensate for low prices. As long as the supply "will last their time," they are perfectly careless of the future, and regard the extinction of the industry as a matter of no importance to them, after they are done with it. Even those few cannery who are fully alive to the consequences of these abuses, and are sincerely desirous of seeing them abated, are forced, in self-defence, to follow the general example. After building and furnishing expensive factories, and in many cases buying out other factories, for the sake of the fishing limits attached to them, they find themselves without any protection, and are liable, at any moment, to see a new factory started beside them, and their already restricted fishing grounds encroached on by some adventurer having nothing to lose. I can only urge the great necessity of immediately placing it under the law and subjecting it to the control of the Department. Overseer Deacon's report has some sensible remarks on this phase of the business, which are worthy of consideration. I have so often expressed my convictions with regard to this fishery, that to repeat them seems unnecessary.

OYSTERS.

While the supply of oysters now obtainable from our exhausted beds is diminishing, the demand for this luxury is increasing. But even higher prices have failed to produce any important increase in the quantity raked. But these stimulated efforts to meet the demand only reduces the prospect of any improvement. The Shediack, Richibucto and Buctouche beds, from which the largest supplies were formerly obtained, now scarce repay the labour of raking. With increased labour, the Caraquet beds have yielded less than last year. The Miramichi beds, which are not yet exhausted, are rapidly becoming so, in consequence of steady and indiscriminate raking during the whole open season, which comprises nine months of the year. If any inducement could be held out to private enterprise, and the system of oyster culture, which has long prevailed in the neighbouring States, could be introduced in this Province, I have no doubt that the capital and labour employed would reap a rich reward.

SYNOPSIS OF OVERSEERS' REPORTS.

RISTIGOUCHE COUNTY.

Overseer Verge, of the Upper Division, reports a decrease in the catch of salmon. He says: "On the New Brunswick side of the river the catch was only 45,731
9—12**

lbs., against 78,660 lbs. last year—a decrease of 32,929 lbs. The Quebec side gave 36,856 lbs., against 63,543 lbs. last year—a decrease of 26,687 lbs. Mr. Verge accounts for this falling off by the presence of porpoises in the estuary, and by a heavy freshet during the fishing season. Unfortunately for this theory, the catch on the coast, below the estuary, shows a decrease from last year, which cannot be attributed to porpoises in the estuary; while the freshet, which would enable fish to pass the nets, would also make them plentiful in the river above, which was not the case, since the angling catch was less than half that of last year. The facts all point to the conclusion that there was a decrease in the number of fish from headwaters to Belledune, the county line of Gloucester.

Overseer McPherson, of the Coast Division, reports a decrease in the catch of salmon. He reports a new lobster factory, additional fishermen, and, of course, an increased catch, exceeding that of last year by 80,621 lbs. In his district mackerel were scarce and fishing very poor. Spring herring plentiful; but low prices kept the catch within the limits of home consumption and the supply of lobster bait; none were put up for shipment.

GLOUCESTER COUNTY.

Overseer Hickson says:—"Taking the season all through, it has been a fair one, and would have been better than an average year, had it not been for the almost continuous stormy weather. The salmon fishery on the coast has been fair. At Salmon Beach the catch has been larger than for some years; but the Madisco and Petit Rocher fishermen did very little. It is useless to theorize as to the cause of this; the plain and simple fact is, that the fish were not on the coast, and the reason is not far to seek. Fly fishing in Nepissiquit was good, and, as usual, there were almost as many anglers as fish." *Overseer Hickson* is of opinion that something should be done to give this river a rest. It is the source and nursery of the important salmon fishery on the coast, and he considers it wonderful that it stands the unceasing drain on its stock. He says: "A movement is on foot to get a portion of the river, or even a few of its pools, set apart for breeding purposes. There is no doubt that this would make a great improvement, both in the shore fishing and angling." The returns show a good catch of mackerel, made mostly by the traps under license, as the hook and line fishing was poor. The catch of herring was only fair. The lobster catch was large, and prices better for good brands. Cod fishing is one of the established industries of this county, but it is not pursued to that extent that profits would justify. It is likely that the Shippegan Railway, now under construction, will give a great impetus to this industry, as it will give fishermen at the lower end of the county a ready means to put their produce into new and better markets than they now have access to.

Overseer Haché, of Caraquet, reports about the usual catch of cod, herring, lobsters and oysters, though stormy weather interfered much with all these fisheries. Winter smelt fishing has been commenced in this district and, so far, has been a source of profitable employment, when such is much needed.

Overseer Cormier, of the herring banks, reports about an average catch of herring and cod. The regulations were well observed by vessels on the banks and good order has prevailed among the crews. He has, therefore, no breach of the law nor any fines to report.

Overseer Haché, of Shippegan, reports no marked improvement in the salmon fishery of his district, but he thinks the quality of the fish better than usual. Mackerel fishing was very poor in Shippegan, which he attributed to the seining practised by American and Nova Scotia vessels. The scarcity of this fish, which is largely used as bait, had a bad effect on the cod fishing in his district, the catch of which was below the average. Spring herring was abundant, and a larger quantity than usual was salted. Fall herring were scarce, which is attributed to the fishing schooners, with their large seines, breaking up the schools and preventing them from reaching their accustomed haunts inshore. Lobster fishing was vigorously pursued and the

catch greatly exceeded that of last year. Smelt fishing has become an important industry in Shippegan; but its great difficulty lies in the distance from markets. Smelts have to be hauled fifty miles to Bathurst, or seventy-five miles to Chatham, before they can be disposed of or shipped for export. The railroad will be a great benefit to this place.

Overseer Sewell, of Pokemouche, reports a decreased catch of salmon, and attributes the falling off to a succession of gales, which disturbed and injured the nets. The catch of mackerel was about the same as last year. With any spirit or enterprise in this district a most valuable business might be done. Mackerel are almost always plentiful during the summer, but the residents have neither suitable vessels nor nets for their capture. Herring were very numerous; but for want of salt to cure them, not many were caught. There is a large increase in alewives and cod, but a decline in hake. Bass and smelt gave largely increased catches, but trout falls short. Lobsters are largely in excess of last year, the quantity canned reaching 510,000 lbs. The total value of the catch in this district was \$33,787, being \$6,007 more than last year.

Overseer Mauzerolles, of Tracadie, reports a good catch of cod, mackerel, alewives and smelt, but a poor catch of salmon. The quantity of lobsters canned largely exceeds that of last year.

NORTHUMBERLAND COUNTY.

Overseer Noble, of Escuminac district, reports a much better run of salmon than appeared in the river last year, and a favourable season enabled a much larger catch to be made. The catch of lobsters was also large, and preparations are being made to start new factories next season. Already are disputes arising about fishing grounds, and he urges the necessity of some regulations to control the fishing. Spring herring were plentiful, but the catch was almost entirely used for lobster bait.

Overseer Williston, of Bay du Vin district, reports all kinds of fish plentiful. The catch of salmon was exceptionally good, and the catch of alewives more numerous than for many years. Smelt and frost-fish were as plentiful as usual, and large catches of both were made. The scarcity of oysters in other places has caused large numbers of people from other places to resort to the beds of Bay du Vin, where the same excessive and indiscriminate raking that has almost exterminated other beds now threatens the destruction of these. Overseers Noble and Williston urge that some regulations be made to protect the oysters in Bay du Vin.

Overseer Stymast, of Tabusintac district, reports an improvement in the catch of salmon as compared with last year. The catch of bass, alewives and smelt was good, but lobsters and cod were scarce.

Overseer Robichaud, of Neguac and Portage Island district, reports a good catch of salmon, which is the most important fishery in his district. Herring and mackerel are usually plentiful in the mouth of the river, and when pursued with any vigor, yield good returns. The catch was not large this year. Bass were not so plentiful as usual. In the early part of the season there was a good catch of lobsters, but as the summer advanced they became scarcer. The winter smelt fishery was largely pursued and gave good returns.

Grand Downs and Lower Newcastle Districts.—The death of Overseer Russell in the early part of the summer, left this district without an officer, and pending the appointment of his successor I placed it under the charge of Overseer Wyse, whose district it adjoins. He reports that he found Bartibog River in so bad a state that vigorous and severe measures were necessary to prevent illegal fishing. He had to employ a small steamboat to clear the channel of illegal nets, and hire special guardians to prevent others being set. After the appointment of wardens, several seizures were made, and a better state of things followed. The catch of salmon in the district was better than usual.

Overseer Wyse, of Napan and Chatham districts, reports an improved catch of salmon. Constant vigilance is still necessary to prevent illegal fishing for bass with

seines and bag nets, and a night watch employed for this purpose was found effective. Gaspereaux have become more plentiful since seines were abolished, but low prices did not encourage a vigorous prosecution of this fishery. The smelt business was, as usual, overdone, and glutted markets, with low prices, was the result. Overseer Wyse thinks that a shorter fishing season would remedy this state of things.

Overseer Hogan, of Newcastle and North Esk district, reports a much improved catch of salmon. Bass were fairly numerous, but the average size is growing smaller. The difficulty of preventing the catching and shipping of illegal fish increases. Dealers, whose true interests should lead them to assist the officers in enforcing the law, encourage poaching by buying the fish illegally caught. Overseer Hogan recommends that no nets be allowed above the flow of the tide, and that during the close season for salmon and bass the railway officials be instructed to receive no fish unless accompanied by the certificate of a fishery officer. I have made these recommendations the subjects of special reports.

Overseer Parker, of Derby, and Overseer Holt, of Blackville, have neglected to send me any report from their districts. My repeated requests have received no attention, not even the courtesy of a reply. I have been obliged to get returns of catch from other sources, which show that an improved catch of salmon has been made in both districts.

Overseer Bamford, of Blissfield, reports better catches of salmon and gaspereau. He says: "The principal abuses that exist in my district are spearing, drifting and setting nets across the stream. I would recommend that overseers be given smaller districts to protect, or have their pay increased to such an extent as will enable them to devote their whole time to the work." With such abuses as he describes—sufficient to exterminate every salmon that reaches his district—it must be admitted that the full time of many officers is needed to remove them, and that the present means of protecting the fish are wholly inadequate.

Overseer Freeze, of Doaktown, reports that in his district the catch has been as usual, without any improvement. This is the natural consequence of what Overseer Bamford describes, and nothing else could be expected. Mr. Freeze says: "During the low water of June and July, while there was a good run of salmon in the tidal waters, very few lived to reach my district. But, after a freshet in the latter part of July, there was a good run. It is the same old story—during low water—'no salmon;' after a freshet, sufficient to drown the nets below, 'plenty of fish.' As to the abuses existing in my district (the same as described by Overseer Bamford), I have so often reported them, and the difficulties of enforcing the Fisheries Act, that I need not here repeat them." Mr. Freeze has some original ideas about salmon protection, and though I do not agree with his commercial views, he would probably feel aggrieved if I were to suppress them. He says: "I am of opinion that the exportation of salmon to the United States should be prohibited. If they were held for Canadian markets alone they would not be so valuable, and excessive fishing would not be the rule, as it is now; consequently there would be more fish for those who would then be engaged in the business. The Canadian markets would then be better supplied at reasonable rates, and aside from the commercial value of the fish, very great benefits would accrue in the value of fishing privileges for sportsmen. I am aware that there is an outcry and numerous complaints coming from those engaged in fishing down river, about the destruction of salmon on their spawning grounds; but I fail to see the difference between killing them on their way to the spawning grounds and killing them when they arrive there, provided it is not in spawning season. As matters now stand, all the fish that escape the nets in tidal waters are few indeed, compared with those that are taken at the mouth of the river and exported to the United States. In order that the ideas I have advanced may be better understood, I would refer you back twenty-five years. At that time salmon were not exported in such quantities as now; their value was not half what it is now; they were a common article of food in every house on this river. They were not much sought after, but being very plentiful, were caught with little labour or expense, and those engaged in it did as well as they now do at more than double the price.

At the present time the high price of salmon is an incentive to poaching that did not formerly exist, and there are nearly as many nets as there are salmon to be caught, and five times the protection is needed to stop poaching."

Overseer Cameron, of Boiestown and Stanley, reports nothing more cheering. He says: "Salmon are getting scarcer every year, which I attribute to excessive fishing in the lower districts, and unless something is done to limit the net fishing below, salmon here will soon be a thing of the past, for the number of parent fish that reach the spawning ground above are yearly growing fewer. If net fishing were reduced in the tide-way and abolished entirely above tide-head, we would soon have fifty fish where we now have one." There is no doubt that *Overseer Cameron's* plan would soon make salmon as plentiful in his district as they were in the good old times described by Mr. Freeze.

KENT COUNTY.

Overseer Guimon, of St. Louis division, reports no improvement in the salmon catch. Herring fishing was good and a better catch than that of last year was made. Alewives were more plentiful, and the catch largely exceeds that of last year. Cod and hake show a decreased catch. Shad rather better, but bass not so good. Smelt fishing continues to increase, and gave good returns. Lobsters appeared to be as plentiful as ever, but the season was late and the quantity canned rather less than last year.

Overseer Hannah, of Richibucto district, reports a slight improvement in the salmon catch. Mackerel were plentiful, and some good hauls were made; but this fishery is not pursued with any vigor by our people, though American vessels are constantly fishing within sight of shore and making good fares. Lobsters were still in good numbers, but the size was smaller than usual. The quantity canned was very large, and exceeded that of last year. The catch of smelts was very large and fishermen got good prices. *Warden Harnett*, of the Upper River, reports bass scarce, but alewives very plentiful. The smelt fishing was good and the quantity caught large.

Overseer Girouard, of Buctouche district, reports a small catch of cod, mackerel and herring. Gaspereau were more plentiful than usual; but fishermen were not prepared to take advantage of the change. Lobsters were about as usual in numbers and size, and the catch an average one. Smelt fishing was more largely pursued, and the quantity caught very much exceeded that of last year. But few oysters were raked; the beds in the river and bay are now so exhausted that the quantity raised does not pay for the time and labour expended.

Overseer Cormier, of the lower districts, reports a good catch of spring herring and mackerel, and a large increase in the quantity of canned lobsters. Rather more oysters have been raised, as the high prices obtained have led to greater efforts on the beds. Smelt fishing was good, and fair prices were obtained for the large quantity caught. Alewives, bass and eels gave an increased catch.

WESTMORELAND COUNTY.

Overseer Deacon, of Shediac and Cape Tormentine district, reports as follows: "The catch of fish in this district has been good for all kinds. Mackerel were plentiful and of good quality; a much larger quantity than usual was caught. Herring were late in coming, but the quality was good and the catch large. A fair catch of bass was made with hook and line, and some were caught with nets. The catch of smelts exceeded that of any previous year; but the markets were over-stocked and prices low; consequently, dealers generally, made no money. Mild and soft weather caused the loss of large quantities. Were fishing deferred until 1st December, much of this waste would be avoided. There were sixteen lobster factories operating in the district, being four more than last year. The whole catch this year ran very small, scarce up to the standard of 9 inches. The season was very backward, few of the factories getting to work before the middle of June. It is most important that this fishery be put under the action of the Fisheries Act. While there are no means

of defining limits, it is impossible to place any restriction on the selfishness and cupidity of those cannerymen and fishermen who seek their own profit without regard to the rights of others. As matters now stand, I find it impossible to prevent the canning of illegal fish. Even those packers who have a sincere desire to observe the law, say they do not know how soon some one will start a factory on grounds hitherto considered theirs. They have gone to large expense in building and furnishing their factories, and have, in many cases, bought out other factories, for the sake of the grounds attached to them, and they ask to be protected in their rights. Until this reasonable protection is given to cannerymen, they will have no interest in the protection of the fish, and no motive to respect the law when they can evade it. Although the oyster beds in Westmoreland are now nearly exhausted, and but little raked in the legal season, the high price paid for them in the close season induces numbers of people to evade the law in every possible way; and I have reason to believe that most of the raking is now done when, by law, it is illegal. Much of my time and labor are given to the detection of this, but I find I am unable to prevent it entirely.

Overseer Goodwin, of Bay Verte and Sackville district, reports a stormy season, with prevailing boisterous weather, which impeded the operations of fishermen. Herring were so plentiful that, even under these unfavorable conditions, a better catch than usual was made. Mackerel were plentiful and of good quality, but only a small catch was made, owing to want of energy and enterprise on the part of our people. The catch of alewives was about the same as last year. A new lobster factory has been started in this district, on the Nova Scotia shore, and promises to be successful. Preparations are being made for more extensive operations next season. Shad fishing at Sackville was somewhat better than last year; but over-fishing prevents any marked improvement. Smelt and bass fishing was commenced last winter in the Tidnish River, with good results. As this fishing was mostly done in the Nova Scotia part of the river, returns and details have been sent to the inspector for that Province.

Overseer Cormier, of Dorchester Bay district, reports herring more plentiful, but shad scarcer than last year. He attributes the falling off in shad to over-fishing. At the beginning of the season, the number of boats and the great length of nets employed in drifting, keep the fish off the feeding grounds. He urges that a regulation be made, prohibiting fishing until the 24th June, and restricting each boat to 200 fathoms of net, so that the main run of fish may reach their feeding places. This regulation will reduce the present excessive fishing and meet the wishes of the great majority of shad fishermen in this district.

ALBERT COUNTY.

Overseer Stewart reports no observable change in his district. About an average catch of all kinds of fish was made, which was used entirely for home consumption. The fishing done in this county is not extensive, but it is of great importance to the resident population who depend on it for their domestic supply.

VICTORIA COUNTY.

Overseer Ryan reports a fair run of salmon in the Tobique. As usual, the great trouble to be met on this river is the spear of both Indians and settlers. The special guardian employed by Mr. Ryan did much to lessen the evil, but to prevent entirely, more assistance is needed, and guardians should be on the river not later than 1st July.

CARLETON COUNTY.

Overseer Lindsay, of the upper district, reports a better run of salmon, and after the close season these were well protected. He reports but one attempt at illegal fishing, and this was frustrated. During the open season 50 salmon were taken by the rod and not less than 1200 lbs of trout.

Overseer Burtt, of the lower district, reports a poor run of salmon, of which very few were caught. But few nets are now used in this part of the river, and those that are set do not pay for the labor of attending them. The lumber interest and the numerous mills in this county have almost drawn attention from fishing.

Warden Scott, at Eel River, reports a better run of salmon and more fish caught than in any season for the last three years.

YORK COUNTY.

Overseer Orr, reports a poor catch of salmon, but a great improvement in bass and whitefish. For the latter there is no close time yet fixed, and large numbers of gravid fish are taken. Mr. Orr urges that their capture, after 30th September, be prohibited, in order to protect the spawning fish. He reports much illegal fishing on the South-West Miramichi, both below and above the portion comprised in his district. He again urges the employment of special guardians to camp on the river and give their whole attention to its protection. He also recommends that the close season for angling should be made to commence at the end of the legal netting season, 15th August. Under the pretence of angling, much illegal fishing is done by poachers, after that date, when sportsmen have left the river.

SUNBURY COUNTY.

Overseer Hoben reports a poor catch of salmon and alewives, but a largely increased catch of shad and bass. The fish for which, a few years ago, there was no demand and no inducement to catch—pickerel, pike and eels—have come to be of considerable importance. They are especially plentiful in that part of the St. John which runs through Sunbury and Queen's counties, and the business of catching them for export has grown into considerable importance. Not less than 60,000 lbs. of pickerel, 5,000 lbs. of perch and 11,000 lbs. of eels have been sent from these counties this season. No sturgeons reached Sunbury County this season; they were all caught in the lower part of the river.

QUEEN'S COUNTY.

Overseer Hetherington reports a better run of salmon than last year. Shad and alewives were also more numerous. Pickerel, perch and eels were caught in large quantities, for export to American markets, where they find a ready sale at paying prices. Mr. Hetherington again urges that drifting nets for shad and alewives in the narrow approaches to Washademoak and Grand lakes should be strictly prohibited, as they prevent the fish from getting to their spawning places.

Warden Phillips, of Canaan River, reports a good run of shad, and later in the season, after the nets were up, a nice run of late salmon. If these fish which, for the last two years, have got safely into Canaan River, were allowed to reach their spawning beds, and could there be protected from the poacher, good hopes might be entertained of seeing this nice river re-stocked. But where all the settlers consider it a part of their religion to kill a salmon whenever and wherever seen, these hopes, under the circumstances, will be disappointed.

KING'S COUNTY.

Overseer Belyea, of Westfield and Belleisle district, reports a better catch of salmon than last year. Bass, shad and gaspereau were about the same as last year, the catch, perhaps, somewhat better. Sturgeons were very scarce, and the summer's fishing the worst yet known. Mr. Belyea is now forced to the opinion that over-fishing has caused the falling off. The last five years' experience having shown that this fishery cannot be commenced earlier than the second week in June, he thinks that fishing might be allowed until 15th September.

Overseer Gosline, of Kenebecasis River and tributaries, reports a much improved run of shad and more salmon than usual. The water was favorable for their ascent, as the unusually wet summer kept the river full. Some sturgeons were caught in the lower reaches of the river, and pickerel and perch are becoming plentiful, though not much used by our people. Their catch for export, now that this business is extending, would afford profitable employment, if followed with any energy.

ST. JOHN COUNTY.

Overseer O'Brien, of the Harbour and Lepreau district, reports as follows: "There was a decided improvement in the catch of salmon as compared with that of last year. The catch of alewives was better, owing, no doubt, to favorable conditions for this fishing. Shad also, were more plentiful apparently, for the catch was considerably better. Our fishermen were much disappointed at the small catch of herring during the winter. For two previous winters fish were very plentiful, and good profits were realized from the large catches made; but from some unknown cause the schools did not come in as formerly. The catch during the summer, however, was almost without precedent—in many instances nets being literally carried away by the numbers of fish striking them. The demand, however, was limited and prices very low. There was a large increase in the catch of lobsters this season, in consequence of the ready sale made to American luggers; the prices obtained gave a great stimulus to this fishery, which heretofore has only supplied the small local demand. In enforcing the close time I have found great difficulty. A number of offenders were prosecuted and fines imposed; but appeals were made on the question of jurisdiction. If convicted under the Fisheries Act its application to the harbour of St. John was denied. If under the corporation by-laws, it was contended that the corporation has no jurisdiction in matters affecting the fisheries. These appeals are not yet decided.

Overseer Skillen, of St. Martin's district, reports as follows: "I have little of importance to report. The catch of herring is below the average; other kinds of fish about the same as last year. The low price of herring during the summer offered no inducement for fishermen to pursue them in this district. Pollack were plentiful, but were not fished for with much vigor—low prices the cause. I fixed the limits of spawning ground under Order in Council of 29th May, between Split Rock and Roger's Head, and had very little difficulty in protecting these limits. What the difficulty may be when the usual fleet of vessels visit these waters in spawning time, remains to be seen. The fish-way in Salmon River dam has been kept in good order and open for the passage of fish. But one complaint has been made with reference to mill-refuse, and the prosecution is now pending.

CHARLOTTE COUNTY.

Overseer Todd, of St. Croix district, reports that the catch of fish was larger than that of last year, but the price of small herring was low. The protection of salmon in the St. Croix River, and especially on their spawning beds, to which Overseer Todd has devoted much time and labour, is now showing good results. He says: "Salmon were numerous, and for the first time in many years several have been taken with rod and line." If due protection is afforded at the head of tide, and the spawning beds saved from poachers, there is now every reason to believe that the river may be re-stocked. The fish-ways are in good order and effective. A new one has been built in Broads' dam, on Denis stream, and I found it necessary, during the run of alewives to place a guardian at this point, to look after poachers, who were trying to prevent the passage of fish.

Overseer Cunningham, of St. Andrew's Bay, reports that herring did not come into the bay last winter in any considerable numbers, and the fleet of vessels which usually fish here was obliged to seek fares in other waters. Small herring did not come until late in July; but the demand was dull, owing to depression in the sardine

business at Eastport. Herring for sardines were plentiful in August and September, but low prices for all kinds of fish prevailed. Lobsters were about as usual. Although the factory has been closed, the demand was good and large shipments were made to Boston and other American markets. Overseer Cunningham strongly urges that no seine fishing be allowed in St. Andrew's Bay, as the practice leads to great waste.

Overseer Best, of Beaver Harbour, reports a decrease in the catch of cod, had-dock, and hake, but a large increase in herrings. The small demand for sardines led to the smoking of a larger quantity than usual in this district. Lobsters were fairly plentiful, and the demand for American markets better than usual.

Overseer Lord, of La Tête and Deer Island, reports as follows: "The year now drawing to a close leaves the fishing industry in this district in anything but a satisfactory condition. The catch of line fish has not been more than half the quantity landed in 1883, with the single exception of pollack, in which there has been a slight increase. To make matters worse, prices for all kinds of fish have been very low. Of sardines, on which a great many of our people have come to depend, the catch has fallen off greatly, with prices lower than when the business was in its infancy. This depression in the sardine business, and the low price of smoked herring, has been extremely hard on weir owners, some of whom have not made enough to pay for repairing their weirs. Nearly as many herring have been smoked this season, but for these, prices have ruled low. The quantity of frozen herring packed was much short of last year's catch; the fish did not, as usual, come to our shores, and nearly the whole catch was made in Grand Manan. The quantity of oil produced is far below the average, as would naturally be the case with a small catch of fish. Taken altogether, this has been the hardest year for our fishermen that has been experienced for a long time, and the prospect at present is not very bright."

Overseer Brown, of Campo Bello, reports a similar decrease in the catch of all kinds of line fish. But the herring fishery has been better, and had prices ruled higher, the season's yield would have reached a fair average.

Overseer McLaughlin, of Grand Manan, reports as follows: "In closing the returns of catch so much earlier than usual, the yield of nearly two months of the best fishing will not appear, and the catch of line fish, as compared with last year, will show a decrease more apparent than real. But the catch of herring in these waters is marvellous, having more than doubled since weirs have been under license. More than 1,000,000 boxes of smoked herring have been shipped from the island this season. The shipment of frozen herring has also been immense, and though prices have been low, the results of the year's work have not been unsatisfactory. There are no abuses in my district to report, nor any breach of the law. The several close seasons have been well observed, and fishermen display an orderly and law-abiding spirit."

I have the honor to be, Sir,

Your obedient servant,

W. H. VENNING,

Inspector of Fisheries, N. B.

RETURN showing the Number, Tonnage and Value of Vessels and Boats engaged in the Fisheries, Quantity and Value of Fishing Material, Kinds and Quantities of Fish, &c., in the Province of New Brunswick, for the Year 1884.

No. 4.

QUEBEC.

REPORT OF THE FISHERY OFFICER IN CHARGE OF THE GOVERNMENT VESSEL "LA CANADIENNE," ENGAGED IN THE PROTECTION OF THE GULF FISHERIES FOR THE YEAR 1884.

GASPÉ, 31st December, 1884.

The Honorable A. W. McLELAN,
Minister of Marine and Fisheries, Ottawa:

SIR,—I beg herewith to forward my report on the Fisheries of the Gulf Division for the season just closed, together with synopses of the reports of the various local fishery overseers, and statistical returns for each of the three counties forming the Gulf Division. These returns show a considerable falling off, especially in the catch of cod fish on the north shore, and salmon on the south shore.

COD

This fishery shows a decrease of 46,932 cwts. as compared with 1883. At Percé, the principle cod fishing station on the south shore, and usually one of the earliest, the fishery only began about the 10th of June. In the Bay des Chaleurs, all fishing operations were delayed by the ice, which only disappeared by the end of May. We had no really heavy gales until towards the close of the fall fishing in November, but the wind prevailed steadily from the eastward throughout the season, and during July especially. This necessitated keeping the boats ashore during the very height of the season. On the north shore the same trouble existed, and the boats were in harbour fully half the season. The greatest decrease in the catch of cod occurred on that part of the coast between Natashquan and Blancs Sablons. As will be easily understood, the prevalence of easterly winds on that coast means an increase in the ordinary current setting up the Straits and along the coast from the Atlantic—which current being increased, an unusual quantity of ice was forced up the Straits of Belle Isle and along the shore. I returned from the Straits on the 20th of August, and I parted with the icebergs only twenty miles below Natashquan. On the morning of the 25th July I left Blancs Sablons, bound west as far as Bonne Esperance, only some 18 miles distant, and in this short distance we counted over 100 icebergs, and passed through much broken ice; many of the larger icebergs were grounded on the fishing banks in twenty fathoms of water; they were of an unusual size, not particularly high, few of them being over eighty feet high, but long and wide; we noticed several which we reckoned to be fully a mile long. This inward set of the ice continued until the end of August, and as a result, we have had a complete failure of the cod fishery. Some idea of the thoroughness of the failure may be had from the fact, that eighteen vessels from the Magdalen Islands returned home in August, having been on the coast since June, with only 10 cwt. of fish among the lot. The poorer families on this coast and on the Magdalen Islands were left destitute, and it was necessary to send them assistance, which was furnished for the purpose, by the Local Government, we taking it in October to the Magdalen Islands and Labrador, and distributing it where it was most needed, by order of your Department. The price of dry cod, as of all other fish, has been low; fortunately for the coast, provisions have never been cheaper, so that with the exception of those on the Labrador coast and at the

Magdalen Islands, who trust solely to the cod fishery for their existence, the majority of our people have never been better off than they are this winter. The foreign markets have been very low, due to an enormous catch of cod in Norway and to the general demoralization of the Mediterranean markets by the cholera. Cod was abundant everywhere when the boats could get out; they were taken off the mouth of Gaspé Bay only a fortnight ago (10th December), and by the last mail from the Magdalen Islands, I am informed by Mr. Painchaud, the Collector of Customs, that the boats were then taking all they could handle, in Pleasant Bay, off Entry Island.

SALMON.

The total catch of salmon shows a considerable increase, but this increase has taken place altogether on the north shore; the decrease on the south shore in Gaspé and Bonaventure being very considerable. On the south coast were caught in 1883, 260,016 lbs., while in 1884, only 171,167 lbs. have been taken, a decrease of 88,849 lbs. or more than half this season's catch. I am utterly at a loss how to account for this decrease. On the north shore (County of Saguenay), in spite of freshets, rough weather and ice, owing to which many nets were not set, and others were carried away and lost, we have an increase which is shown by the following table:—

	Barrels Salted.	Fresh in Ice.
1884	1,071½	156,576 lbs.
1883.....	695½	80,126 "
Increase, 1884.....	376	76,450

Or allowing 300 lbs. to the barrel, a total increase for this year of 189,250 lbs., being more than half the catch of last season. The fishery was every where late in beginning. It was noticed on the north shore, and at Anticosti, that the fish were a larger run than usual, while on the south shore the fish were smaller.

HERRING.

The herring catch was small, though it shows an increase of 5,270 barrels over last season. For the third spring in succession, the early herring fishery in Pleasant Bay, Magdalen Islands, has failed completely, or rather it has not existed at all, as the schools of herring were not able to get into the bay to spawn during the first spring tides of May. They must have passed on and made for Bay des Chaleurs, as herring were taken abundantly on both shores of the upper part of that bay during the end of May. They are there taken chiefly for manure, a few thousand boxes are smoked, and a small quantity exported to Boston and the West Indies; being thin they keep better in warm latitudes than the fall herring. Summer and fall herring were abundant, a large quantity was taken on the north side of Anticosti and about Natashquan, these were mostly sent to Quebec and Montreal, where, owing to the scarcity of Newfoundland herring, (their fishery having been a failure), they commanded good prices. The Inspection Act has had the effect of making our fishermen more careful in the curing of their herring, as a result, they command a better price. There is, however, still plenty of room for improvement.

MACKEREL.

An increased interest was taken in this fishery during the season just closed, and considerable outlay was made by local fishermen, and others from Nova Scotia. Five trap nets were licensed and set, and a considerable number of gill nets, but I am sorry to say that the fishery was a complete failure. The few mackerel taken were of good quality, but no large schools ever come west of Cape Breton. The fishermen were, however, not disheartened, and I believe that a still further interest will be taken in the mackerel fishery next season.

HALIBUT.

The quantity of halibut taken was about the same as last year. The halibut fishery is not prosecuted by our fishermen as a separate fishery, halibut only being taken by the cod fishermen, who generally consider the hooking of a halibut a nuisance, so that they rather avoid the bottoms where halibut are sure to be taken. No American halibut trawlers were seen about the coast this season.

LOBSTERS.

A considerable increase is shown in the quantity of lobsters taken. In 1883 were taken, 606,154 lbs., this season the returns give us 788,283 lbs., an increase of 182,129 lbs.. The increase is mostly in the County of Bonaventure, where the lobster fishery having been abandoned for a few years, the fish, as would naturally have been expected, have had a chance to increase. The extension of the fishing season granted this year was not generally availed of, most of the canneries had closed down sometime before the 20th of August, others had prepared to close, and did not care to alter their arrangements, when they learned that an extension had been granted; so that only those that had been urging this extension, and expecting to get it, were prepared for it when it came. It would be better either to make this extension permanent, and I don't see that any great harm would be done by doing so, at the Magdalen Islands, or else in the future to refuse it.

SEALS.

For the third year in succession this fishery has been a failure. The falling off being for this season 8,754 skins and 77,368 gallons of oil, as compared with last season, which was in itself a poor one. For a successful spring seal fishery, it is necessary that the schooners should get out from their winter quarters about the end of March, and manage to penetrate into the seal bearing fields of ice, among the young seals. This spring as in both the preceeding ones, owing to the continuous east wind in March and April, the ice was jammed on shore, at the Magdalen Islands and on the north shore, from the east end of Anticosti over to Natashquan; so that the vessels could not get out of harbour, and work in among the floes, in time to get at the young seals before they are old enough to take to the water. This fishery is prosecuted entirely with small and weak sailing vessels of from 15 to 45 tons, the fishermen are consequently entirely dependent on a favorable state of wind and ice for a successful fishery. One good steamer would stand more chance of getting at the seals than the 50 schooners that are engaged in the fishery. Four sealing schooners from Esquimaux Point were nipped in the ice, off the East Point of Anticosti and lost. Fortunately no lives were lost, as the crews were able to make the land over the ice. As these vessels were uninsured, their destruction has been a very serious loss to their owners. The sedentary seal fishery on the Labrador was good. In some localities this fishery is carried on in December, while the seals are running up the coast through the passes and leads, among the islands; nets made with a large mesh, of heavy twine, are strung across a narrow channel where the seals are known to run, these nets are allowed a good deal of slack in which the seals get entangled and drowned. Some of the fisheries yield an average of 1,400 seals. At Bradore Bay and Long Point this fishery is made in the spring when the seals are running out.

BAIT.

Bait was sufficiently abundant on the south coast, at Anticosti and the Magdalen Islands and on the north shore west of Natashquan. Below Natashquan, the capelin never struck in, they remained in deep water outside the belt of ice. A large and well furnished guano factory has been completed at Salmon Bay, it is owned and will be worked by the Newfoundland Guano Company. It will be ready for active operation next spring, and I hope it will be a success. I trust that others will

follow on other parts of the coast, where fish offal is most abundant, as at Percé, Natashquan and Magpie, where an enormous quantity could be collected within a limited distance.

The Fishery Regulations have been well observed in the Gulf Division, and the various local overseers have been active in their duties. It is to be hoped that the Local Government will not much longer delay in putting reliable overseers on the salmon rivers above the tidal waters, as unless the rivers efficiently guarded, and the spawning beds protected, the observance of a vigorous close season for net fishing, will be of little use, already the net fishermen are complaining that while we look closely after them, and they are compelled to pay a license for what they catch, the rivers to which they must trust for a continuance of the supply of fish are neglected.

SYNOPSIS OF OVERSEERS' REPORTS.

RISTIGOUCHE DIVISION.

Overseer J. A. Verge reports a falling off in the salmon fishery; in 1883 the yield was 63,543 lbs., this season's yield being only 36,856 lbs., a decrease of 26,687, or about 42 per cent. The heavy rains during the better part of the season caused a very great rise of water, and a run of brush and debris, which interfered very much with fishermen, preventing them from keeping their nets in good fishing order, and when the waters subsided the green moss or slime began to rise from the bottom, so as completely to preclude any further fishing. The porpoises were numerous during the month of June, coming as far up as Campbellton, after they returned seaward there was a better run of salmon, so that with the damaging freshets, and return of the porpoises so far up the estuary, the falling off is in a measure accounted for. The Sunday close time was well observed, and most of the licensees showed their willingness to conform to any new regulations imposed.

NEW RICHMOND.

Overseer Cullen reports a decrease in the catch of salmon, in 1883, 69,372 lbs. were taken, while in 1884 the catch was only 63,616 lbs., or a decrease of 5,756 lbs.; he cannot well account for this falling off, unless it be that bait having been plentiful in the deep water the fish did not strike the shore until after the net fishing season was over. The summer cod fishery in the upper part of the bay was a failure, in fact it is but little prosecuted. The fall cod fishery was good, and had it not been for the rough weather, the quantity taken would have been much larger, as when the boats could go out they made good catches. Mackerel and trout fishing were failures. Spring herring were unusually abundant, the people taking as much as they could handle, for local consumption, export, and manure; when the fishing was abandoned, the bays were still alive with them. Lobster fishing was much better than last year, when only 2,340 lbs. were taken, the yield this year being 69,000 lbs., an increase of 66,660 lbs.

PORT DANIEL.

Overseer Phelan reports the catch of cod as being considerably below that of last year, though still about an average. Most of the boats cross to the New Brunswick side of the bay at Miscou and Pokeshaw. Cod fishing began on the 10th of June. The fall season was rough and stormy, the catch would have been fully as good as last year had the boats been able to get out. Salmon fishing began on the 5th of June and most of the nets were up before the 20th of July. The catch is slightly smaller than last year, the advance in price fully compensated for this deficiency. The general opinion among fishermen was that a week's good fishing was lost by not having the nets out earlier, there was, however, so much drift ice about, that this was impossible. Spring herring were very plentiful and were largely used for manure. Summer herring, usually taken in August and September, were scarce, but in October, fall herring of fine quality were taken abundantly, they were of an unusually large size, and fat. The inhabitants have never been better supplied for the winter

than they are at present. Several American schooners called in Port Daniel bay after mackerel, but none were taken. Capelin struck in on the 10th of June, but only remained a few days. Squid were very abundant during the fall. The lobster fishery was good, 41,370 lbs. were taken in 1883, this season 88,644 lbs. were canned, being an increase of 44,274 lbs., or more than the entire catch of last year. No contravention of the Fisheries Act came under Mr. Phelan's notice this season.

GASPÉ DIVISION.

SALMON FISHERY.

P. Vibert, Overseer, reports as follows:—

The ice left Gaspé two weeks earlier than usual, and the navigation was opened the 5th May. Salmon nets set 15th to 20th, and first fish taken 19th May; fishermen were disappointed in the catch, as the fishery was only half of last year's. Some old fishermen consider the large pack of ice, which was jammed to the southward of the Gulf, either kept the fish away or turned many in a different direction. Nearly all the salmon taken were of small size, for instance, at Little Pabos about 200 fish were netted in Mr. X. Tetu's stand, of an average of 10 lbs. each. Total catch, including angling score, was 55,000 lbs, or about half less than last year. Water was very clear in June and many escaped the nets.

COD FISHERY.

Cod struck at Percé 6th and 7th June in small quantities. The summer fishing was about half of average years. July was a lost month, owing to easterly gales and fog; from 7th to 22nd the weather was so wet and stormy that men could not get out. At Point St. Peter, in 18 days, twenty-three boats averaged three drafts each. There was no fish in deep water or on the bank towards the middle of July—some who went half a mile outside, in many cases did not feel a bite. Gales of wind during September caused much lost time, and the fall catch was poor. Late in the season some fish was caught, and if it had not been for the sudden advent of wintry weather much more might have been taken. The average per boat may be estimated at forty quintals for summer, and twenty quintals for autumn fishing. The number of vessels cleared at this port with cargoes for the markets, was twenty-five, and five from Percé, besides five ships from Pabos with deals for Messrs. King Bros.

The fish markets were much depressed, owing to the outbreak of cholera in Italian fish ports. In a daily Montreal paper it was stated that a cargo of cod that arrived in Spain, had been sent to Portugal, and would be forwarded to the West Indies.

LOBSTER FISHERY.

The number of cans sealed at the five establishments is as follows:

Belle Anse.....	22,455
Cape Despair.....	40,000
Seal Cove.....	2,000
Grand Pabos.....	21,000
Newport.....	25,200

110,655

Being an increase of 18,655 lbs. over last season. Besides, 4,715 cans of spiced salmon were put up by Messrs. Hoeg at Belle Anse. This factory commenced operation on 2nd June and closed 31st July. I visited the cannery 4th and 5th July. About 20,000 lbs. lobsters were delivered during those two days. The general run of lobsters was small. I warned fishermen against taking the small ones and those with eggs attached. All seemed willing to comply with the law. June, being a fine month, was favorable to lobster fishermen, and, so little cod on the grounds, many turned their attention to putting out lobster traps.

Mr. Windsor's establishment, at Grand Pabos, was burnt with all its contents, on 27th June.

MACKEREL FISHERY

Proved quite a failure; very few were reported in the bay, and those that came would not bite. It was a great loss to the people, as last year over 500 barrels were caught, and sold well.

WHALE FISHERY

Proved a failure owing to rough weather and ice. Captain Tripp was down in the straits in June and July. Anchored for two weeks at one time with gales, easterly wind, and icebergs coming up, some a mile long. Killed four whales altogether which gave 2,000 gallons of oil.

ANGLING.

The following is the number of salmon killed with the fly on the four rivers in this division. No anglers at Pabos or Malbaie Rivers.

	Fish.	lbs.
Dartmouth	38	550
York.....	82	1,102
St. John.....	52	829
Grand.....	55	804
	<u>227</u>	<u>3,285</u>

Three fish caught on the York weighed 31 lbs. each. One at Grand River was 25 lbs.

June and August were not favorable to anglers, [the water being too clear] in July too wet. Dartmouth River rose about 6½ feet on the 14th July. Considering the small run of salmon there was a fair stock of fish in the rivers.

STE. ANNE DES MONTS DIVISION.

Overseer *Létourneau* reports the cod fishery as being slightly below that of last year. The fish only reached that part of the coast in July, none having been taken in June. The fall fishing was good. Towards the end of November they were still abundant; but the north winds, which prevail at that season, prevented any boats from getting out. The salmon fishery has been better than last year, due to an increase in the number of nets. Salmon were abundant on the spawning grounds in the fall, and of large size. A good many salmon were seen in the Cape Chatte River. The fly fishing in the Ste. Anne's River was excellent, and would have been much better had not the water fallen too low for good fishing early in the season. Some very large trout were taken with the fly.

Herring were scarce in the spring but abundant in the fall. Mackerel were scarce but of good quality. One American mackerel schooner called here to repair damages. Capelin were scarce, none having been taken in the western part of this division.

GODBOUT DIVISION.

Mr. N. A. Comeau, who was employed this season as special fishery guardian owing to the absence of the regular overseer, reports as follows:—

The season of 1884 has been rather more favorable for salmon than the two preceding years. This increase has been especially noticed on the portion of the coast between Moisie River and Point des Monts, particularly near the latter place, showing an increase of more than one-half the usual catch. Above Point des Monts the net fishing was very poor and salmon seemed to be scarce. In the Godbout River, where ample chances were afforded of observing the numbers of fish entering that

stream, I would say that only about two-thirds the usual quantity were seen. This may have been owing to the high state of the waters all through the season, which would, in a great measure, prevent the fish from being observed as easily as during a low state of the river. In any case there was a great scarcity of salmon in the small rivers of Becsle, Mistassini and English Bay. None were observed in August in the two last mentioned, and in the Becsle about a dozen fish were seen. In the Bersimis River a very insignificant number of salmon were speared by the Indians of the reserve. The fish which used to be so abundant in this fine stream are being gradually exterminated. The Indians lay the blame on the mill-owners for this scarcity, but I cannot help thinking that it is attributable to their own want of forethought in spearing the fish at all seasons, even on their spawning grounds.

Trout appeared to be everywhere tolerably abundant. The catch in the Godbout this season has been an average one. About seven thousand trout were killed. Of this quantity two thirds or more were caught by angling by visiting sportsmen, residents, Indians and others. The balance was caught by seine net by the proprietors.

No mackerel were seen in Godbout Bay this season. The same may be said of cod. This last fish, at one time very abundant here, seems to have deserted its former resorts and for quite a number of years now the fishing has been poor. This last season, however, was still worse, as none could be caught; not even enough for local consumption.

Some attempts were made during the season at Pointe aux Outardes and Manicouagan of creating and opening up a new branch of fishing (for this coast at least). I am speaking here of sturgeon. I am happy to state that I believe these efforts will be successful. For the want of properly made nets and the knowledge required for this particular fishing, only a small number were taken. Sturgeons are very abundant there, and very large ones, some having been caught over twelve feet long. I saw one there myself of ten feet in length. Thirty-four, big and small, were taken in one haul.

At Manicouagan, a resident there, named Thibeau, caught fifteen in his seal nets. While there, in August last, I ascended the Manicouagan river to the falls, and saw several sturgeons on my way. There were also immense numbers of small tommy-cod smelts, and a species of carp or sucker, in the river at the time.

Young herring—or, as they are improperly called, sardines—are very abundant on the banks, and afford food for the great numbers of seals and porpoises to be found on the edge of the shoals, and the estuary of the Manicouagan river. Some years ago Joseph Thibeau had a weir fishery there, in which he caught as much as fifteen barrels of this young herring in one tide.

About two hundred seals were killed or taken with nets by Indians and others during the season of 1884 at Manicouagan. Of the various kinds of seal that occur in the St. Lawrence, and which frequent these shoals during the summer season, I have identified beyond a doubt the following named species, viz.: *Phoca Vitulina*, harbor seal; *Phoca Grœnlandica*, harp or Greenland seal; *Halicharus Grypus*, grey seal, and *Cystophora Cristata*, hooded seal. I am almost certain that *Phoca Fœtida*, fetid seal, occurs here also, but could not secure or see any. The white whale, *Delphinapterus Cetodon*, and the puffing pig, *Beluga Cetodon*, are very numerous, and large herds frequent this vicinity (Manicouagan) all through the summer.

At Point des Monts the seal hunting (I cannot call it fishing), has produced between 450 to 500 seals this year, killed by Indians and resident hunters.

The question will now naturally be asked, what is the cause of the absence of mackerel and cod, and the scarcity of salmon above Point des Monts this year? I would say, in reply, that it was due to the almost total absence of (caplin and sand eels), caused by the prevalence of westerly winds during the season. This had the effect of creating a continuous surface current of two or three miles per hour, running down along this shore to Point des Monts, where it is set off to the southward, thereby causing a sort of eddy or flood tide on that part of the coast below. Bait would naturally be drawn in this immense eddy. Her

abundance of bait there, and as a natural consequence salmon, cod, mackerel, &c. more abundant than last season.

TRINITY DIVISION.

Overseer Belanger reports the early seal fishing about Point des Monts as being good, though the hunters (the seals are killed with the gun) report the winter to have been rough and cold. Twenty-two canoes, manned by two men each, engaged in this hunt during the winter. The salmon catch has been good; fish were very abundant in spite of the freshets, rains and general rough weather; there can be no doubt that had the weather been more favorable the catch would have been much greater. The gentlemen who fished the Trinity River did well; very few trout were taken, the weather was too rough in July to keep out the nets which are mostly fished in exposed places along the coast. The Fishery Regulations concerning these two fisheries were strictly carried out. The cod fishery, which in this division is only prosecuted towards the fall, has been better than last year. In the early part of the Fall the fish kept in very deep water and but few were taken; towards the close of the season, however, they struck in shore and fishermen managed to save their time. Herring were plentiful in the spring, but being of poor quality, few were taken. Mackerel were scarce and none were taken by the local fishermen; 21 barrels were taken in a trap net set at Cawee by Mr. Cunningham.

MOISIE DIVISION.

Overseer Mignault reports salmon fishing as having commenced at Moisi River on the 21st May. The fishing was good; 4,504 salmon were taken in the river, the total quantity taken in this division amounting to 102,826 lbs. The salmon were of large size; most of the fish were caught in the month of June; from the 5th to the 15th July there were heavy floods in the rivers, which completely put an end to the fishing. Four gentlemen arrived on the 12th of June to fish with the fly in the Moisie river; not being very expert fishermen they only took about 50 salmon. These gentlemen refused to give any returns of the quantity of fish they had taken, alleging that they had only to deal with Mr. Holliday. The cod fishery began on the 1st of July and fish were plentiful, but the rough weather seriously impeded the fishery. Herring were abundant, but the catch was not great, fishermen fearing to keep their nets out on account of the heavy sea and strong tides. In Seven Islands Bay, 297 barrels of mackerel were taken by 16 schooners from Gloucester, Mass., and Nova Scotia. Porpoises were abundant off Moisie and considerable damage and loss was caused to the outside salmon net fishermen by these animals.

MINGAN DIVISION.

Overseer Duguay reports the summer cod fishery as only middling in the western part of this division, due to the fishermen having lost fully half their time owing to rough and changeable weather. At Dock Creek and Rich Point the fishery was better, as the boats were more often able to put out, and could remain out longer owing to the facilities at these stations for harboring. At Magpie and St. John's River the summer fishing was poor from the same causes as in the west. The fall fishery was about an average; as a rule fish were plenty on the banks when the boats could get out. The fishing was good, the yield being considerably greater than that of 1883. Herring were particularly abundant in the fall, especially about Magpie Bay, and could have been cured had fishermen been able to procure barrels. The seal fishery from Esquimaux Point was a total failure, the vessels were unable to get into the bay in time to get at the young seals. Four schooners from the point were lost at the east end of Anticosti, fortunately no lives were lost. The summer cod fishery was a failure at this place. Those who were able to procure suitable boats made a fair fall fishery. Only four schooners went down to the Straits for fall herring, these vessels returned empty, the other two had about half fares.

NATASHQUAN DIVISION.

Overseer Mathurin reports the spring seal fishery in this division a failure. The summer cod fishery was not up to the usual average, due entirely to rough weather in June and July. At one time in July the boats were ashore for fifteen days in succession. The fall cod fishery was good, as was also the herring fishery, which was the most abundant ever known at Natashquan. Salmon were abundant and the yield from the River Natashquan was greater than for some years.

WASHEECOOTAI DIVISION.

Overseer McLeod, reports that he arrived at Romaine on the 25th May. The spring herring fishery had been a failure, owing to the ice the vessels could not get into Washeecootai Bay when the herring were in considerable abundance. No codfish was taken before the 11th of June, and then only a small quantity. Twenty vessels visited the division for codfishing, but they only took about 30 cwts. among them all. No salmon nets were set before the 1st of July, and no fish was taken before the 15th, when a few were caught in the nets in the estuary of the Romaine. In the Washeecootai, Musquaro and Kegashka Rivers the fishing only began a few days before the end of July. The salmon net fishermen, claim the right of keeping down their nets until the 15th of August, by an order granted by the Department some years ago, but as Mr. McLeod had no knowledge of the existence of this order, he did not allow them to keep down their nets after the close of July. Most of the fishermen who carried on fishing in Kegashka Bay, have abandoned the place and gone to Ontario.

ST. AUGUSTINE DIVISION.

Overseer Legouve reports considerable distress in his division, mostly among the old settlers on the coast, who not being fitted for deep water fishing, have done nothing. The general failure in this division, has been caused by the ice and continual gales of east winds. The small catch of salmon is due to the same cause, as many nets were carried away by the ice and other stations were never fished at all. Salmon were very plentiful, and there would have been a good catch had the weather been favorable. The herring fishery was also a complete failure. Mr. Legouve states that the St. Augustine division should be divided and placed under two officers, as it is impossible on account of its extent to guard it effectually. For several seasons back the fishing has been poor, but the moment we have a good fishery, the rush for trap nets for cod will be so great, that it will be impossible for him to keep order.

BONNE ESPERANCE DIVISION.

Mr. Whitely reports the salmon fishery as poor, the fish seemed to be plenty judging from the catch in St. Paul's River, but owing to the ice and sea, the outside were either not set at all, or so damaged by the ice as to be useless. The codfishing began with good prospects, but the continued run of ice out of the in-shore waters and off the banks into deep water. Capelin were very scarce and launce also. Herring and mackerel never put in an appearance at all. Heavy gales of easterly wind prevailed during the season, for fifteen days from the 8th of July, which is usually the height of the fishing season; it blew uninterruptedly a whole gale from the eastward. Prices of salmon and cod are lower than they have been for some years. Newfoundland vessels visited the coast in increased numbers, and were it not for the presence of "La Canadienne" we should have had troublesome times.

MAGDALEN ISLANDS DIVISION.

Overseer Chevrier reports as follows: The fisheries of the islands generally are below the average. The codfishery, especially, has almost entirely failed on the east

and north coasts of the islands, and has been below the average on the south and west coasts. The Labrador codfishery in vessels was a total failure. These poor results are attributable everywhere to the rough weather. All the fishermen agree that they have never experienced so rough a season. The herring and mackerel fisheries have also failed, and for the same reasons, and the same story may be told concerning the spring seal fishery. The vessels could not get out owing to the ice being packed around the islands until well into May. The lobster fishery is the only one that gives an increased return; a much larger number of men and boats were engaged in it, and many more traps were set.

From the foregoing abstracts your Honor will see that, from one end of the gulf to the other comes the same complaint, and that the great falling off in the deep-sea fisheries is attributable solely to the unusual roughness of the season. July is usually the best month for the codfishery, and if a good fishery is made during this month the season is considered safe. During the season just closed, it was the roughest month of the lot, and from the 7th to the 20th it was so stormy that nothing whatever was done. Cod were not scarce, but they remained in deeper water than usual, and the bait kept off shore. As usual, in stormy seasons, the less sheltered stations where the boats have to be hauled ashore, have suffered most. When the boats could be kept afloat in sheltered coves, so that they could get out at once when the storm was over, they always found fish and did well. All this points to the necessity for larger boats that can stand the rough weather, and sheltered harbors, so as to avoid the necessity for hauling boats ashore at the first sign of rough weather. Boats that are sure of making a snug harbor when they return, hang on to the fishing grounds to the last moment, while others that have to be beached must get away in time to pick up their moorings, land their fish and ballast, and be hauled up. This is fatiguing on the men and strains the boats, and when it has to be done once or twice a week, it means not only a great loss of time, but it disheartens and discourages the fishermen, and several days elapse before the less energetic ones can be got afloat again. A good deal of discontent is shown by some of our fishing population against the introduction of trap nets for mackerel. This season we have had five traps licensed, two on the north shore and three on the south. On the south shore I have heard no complaint, but on the north shore petitions have been sent to your Honor against these traps; it has been charged that they destroy a great quantity of young salmon and bait. I confess that I do not share myself in these objections. I visited all these traps, and found no young salmon in any of them. It is true that they pick up a good deal of bait, but this is utilized by the cod fishermen in the vicinity. I do not consider that traps do anything like as much damage as seines. I believe that mackerel, herring and cod run no risk of being overfished by any quantity that men can catch; but I do believe that we may drive them out off our bays and off our coasts by disturbing them with the seine and jig. The trap net does not do this; it fishes quietly and silently, and does not alarm or shy the fish. In certain situations they may take young salmon; and I would certainly not license a trap to be set a second time in any cove where I was sure that young salmon would be taken. This is the first season that mackerel traps have been set in my division. They are very costly affairs to procure and set, and the license fee itself is high. They did nothing whatever this year, and have caused great loss to their owners; they will be tried again next season, and should they not be more successful we will not be likely to have any more trouble with them, as they will surely be abandoned. We have had no experience of them on this coast, but they have been in use for some years about the coast of Nova Scotia, and your fishery officers in that Province should by this time be able to say whether they are really as destructive as those who are opposed to them here make out.

I have the honor to be, Sir,

Your obedient servant,

W. WAKEHAM.

Fishery Officer in command of *La Canadienne*.

No. 5.

SYNOPSIS OF FISHERY OVERSEER'S REPORTS IN THE PROVINCE OF QUEBEC, EXCLUSIVE OF THE GULF DIVISION, FOR THE YEAR 1884.

SOUTH SHORE DIVISION—FROM POINT LEVIS TO CAPE CHATTE.

From Point Levis to River Ouelle—F. C. CARON, Fishery Overseer.

The yield of fish in this division, is given as follows:—

			\$	cts.
Salmon	lbs.	8,530	1,288	50
Trout	lbs.	7,000	560	00
Shad.	No.	20,457	1,841	13
Eels.....	No.	117,723	11,772	30
Herring.....	brls.	2	10	00
Sturgeon.....	brls.	1,026	5,130	00
Bar and whitefish.	doz.	3,722	4,652	50
Porpoise skins.....	No.	54	216	00
do oil.....	gals.	3,210	1,620	00
Mixed fish.....	brls.	269	780	00
Fish for manure....	brls.	473	118	25

Total value.....\$27,988 68

Overseer Caron reports an unusual absence of quarrels among fishermen in his district, which were so prevalent in former years. Not a single instance of dispute was reported to him during the fishing season. The value of the fishery products is about the same as in 1883. The slight falling off in the catch of salmon, shad and eels is made up by the increased yield in sturgeon, porpoise and coarse fish. Trout are reported plentiful in the inland waters of this division.

FROM RIVER OUELLE TO ISLE VERTE.

JULES GAUVREAU, Fishery Overseer.

The yield of fish in this division is given as follows:—

			\$	cts.
Salmon	lbs.	16,580	2,487	00
Trout	lbs.	4,000	320	00
Herring.....	brls.	7,780	38,900	00
Sturgeon.....	brls.	420	2,100	00
Shad	No.	40,375	3,633	75
Eels	No.	40,770	4,077	00
Sardines.....	brls.	6,666	19,998	00
Porpoise skins.....	No.	17	68	00
do oil.....	gals.	1,020	510	00
Mixed fish	brls.	1,726	5,178	00
Fish for manure....	brls.	4,073	1,018	25

Total value.....\$78,290 00

Overseer Gauvreau reports a falling off in nearly all kinds of fish. This, he ascribes to the unfavorable weather which prevailed during the height of the fishing season. No violation of the fishery laws came under this officer's notice.

FROM ISLE VERTE TO RIMOUSKI.

H. MARTIN, *Fishery Overseer.*

The following table shows the yield of fish in this division:—

Salmon.....	lbs.	14,280
Trout.....	lbs.	13,000
Shad.....	No.	3,556
Eels.....	No.	2,875
Herring.....	brls.	4,992
Sturgeon.....	brls.	3
Sardines.....	brls.	690
Mixed fish.....	brls.	71
Fish as manure.....	brls.	3,340
Total value.....		\$31,382 54

Overseer Martin reports that violent storms destroyed a large number of weirs, and to this cause he attributes the decrease in the yield, as compared with 1883. Salmon and sardines are the only kinds of fish which show a slight increase. Trout were abundant in the inland waters of this division. The fishery laws and regulations appear to have been well observed.

FROM RIMOUSKI TO RIVER BLANCHE.

L. E. GRONDIN, *Fishery Overseer.*

The yield of this district is stated to have been as follows:—

Salmon.....	lbs.	7,640
Shad.....	No.	1,800
Herring.....	brls.	12,281
Sardines.....	brls.	1,215
Total value.....		\$66,358 00

Overseer Grondin reports a falling off in the catch of salmon and shad. Other kinds of fish yielded as much as in 1884, in spite of the bad weather experienced throughout the fishing season.

FROM RIVER BLANCHE TO CAPE CHATTE.

J. BTE. SAUCIER, *Overseer.*

Statement of the yield and value of the fisheries of this division:—

Salmon.....	lbs.	3,770
Herring.....	brls.	750
Sardines.....	brls.	65
Coarse Fish.....	brls.	6
Fish for Manure.....	brls.	200
Total value.....		\$4,578.50

Overseer Saucier reports salmon plentiful in Matane River. Angling was good; about one hundred fish being caught with the fly. The largest fish weighed 21½ lbs. Several nets, a canoe and three spears were confiscated by the water policemen which were sent there by the Department to assist the overseer in protecting the river. Two parties detected spearing under Price's mill were fined \$7 and costs.

QUEBEC AND MONTMORENCY DIVISIONS.

L. P. HUOT, *Overseer.*

The following is a comparative statement of the Fisheries in this Division :—

Kinds of Fish.		1881.	1882.	1883.	1884.
Salmon.....	Lbs.	1,950	2,900	2,640	3,750

Overseer Huot states that the yield of fish in his division was fully equal to that of previous years, with the exception of bar and whitefish which show a slight falling off. Five eel-weirs built with wire netting were set at St. Joachim and proved much superior to the old system. Most of the fish caught in this division are sent to local markets. No breach of the law was reported.

MURRAY BAY DIVISION.

ULYSSE BHÉREUR, *Overseer.*

ANT. FILION, }
 JOS. SIMARD, } *Wardens (Inland Lakes.)*
 HENRI COTÉ, }

Value.....		\$16,953 00	\$18,111 50	\$20,789 75	\$18,299 50

Overseer Radford reports the number of fishing stations still further decreasing, owing to more remunerative employment being found elsewhere. Although salmon net fishing shows a falling off, angling was considered pretty fair. The special fishery guardians report the rivers as generally well stocked with parent salmon. An investigation of illegal trout fishing was held at Portneuf. It was evident that the mill hands were the guilty parties, but the offence could not be made sufficiently clear to warrant a conviction.

LAKE ST. JOHN DIVISION.

JOB BILODEAU, }
CHAS. POTVIN, } *Wardens.*
R. MALTAIS, }

SHERBROOKE, COMPTON AND MEGANTIC DIVISIONS.

W. C. WILLIS,
J. B. McDONALD, } *Overseers.*
P. C. BOURKE,

Overseer Willis, of Sherbrooke, reports that large numbers of pike were caught in Massawipi Lake during the early spring. Whitefish, some weighing as high as 8 lbs., were caught in Magog, Brompton and Massawipi Lakes. The run of salmon in the St. Francis River was fair. There were fewer anglers than formerly to enjoy the sport on Magog River. Two fishways were built during the summer, and another is to be put up next season.

Overseer J. B. McDonald, of Echo Vale, reports angling for lunge and bass as good in Lake Megantic. These fish are steadily increasing since nets were prohibited. A great many sportsmen went away satisfied with their visit. Several night lines were confiscated and one party was convicted for fishing illegally; another escaped before the overseer could get him arrested. There are still a few poachers; but, generally speaking a marked improvement is noticed in the observance of the fishery laws and regulations.

Overseer P. C. Bourke, of Somerset, reports fish as decreasing in the waters of Megantic county. This, he attributes to the fact that the eggs are destroyed on the breeding grounds by small worthless fish, also to the want of efficient fishways on several streams in his district.

No. 6.

PRINCE EDWARD ISLAND.

ALBERTON, 31st December, 1884.

To the Honorable
The Minister of Marine and Fisheries.

SIR,—I have the honor to transmit the Inspector's Annual Report on the fisheries of this Province, together with tabulated statements of the yield and value of the different kinds of fish and fishery products for the year 1884.

SUMMARY.

The past year has been a poor one for the fisheries, the shortcoming in value, as compared with the preceding year, being no less than \$186,849.25 short of 1883. Excepting on lobsters, on which there is an unlooked-for excess, the deficit ranges over all the fisheries, the large shortcoming in mackerel being 11,304 barrels; on herring, 10,223 barrels; and on cod, 6,859 cwt. The falling off in catch may be attributed rather to protracted bad weather than to scarcity of fish.

Statistics of fishing force and plant, as given by the wardens' returns, show 47 fishing vessels, with an aggregate tonnage of 1,764 tons, manned by 282 men—being a considerable increase — and 1,163 boats, spreading 58,417 fathoms of nets, with 3,738 men, giving a crew of a little over three men to a boat. Last year were owned and used in the Province, thirteen seines; this year, thirty-eight. Cod gill-nets have been given up as unsuccessful.

Herring were not nearly so abundant as last year. Bait for the other sea fisheries was, therefore, somewhat scarce, and much had to be imported. Of the total quantity of 36,217 barrels of herring taken, only 7,691 barrels were put up for food, and the remainder used as bait. In like manner, of the 1,483 barrels of gaspereaux, only 414 were for food.

Haddock show a small falling off; cod, a large deficiency, the figures being, last year, 26,702 cwt., and this year, 19,843. The catch of hake reached about the average of past years—say, 9,231 cwt. Although this deficit is partly attributable to bad weather, it is also partly owing to the circumstance that this—the most reliable of all fisheries—was not pursued with the energy that men exhibit in fishing for mackerel. A large number of New Brunswick and some Nova Scotia boats were fishing chiefly off North Cape, and did better than ours, their boats being larger and better equipped.

The mackerel fishery is very largely under the average of past years—only 16,866 barrels taken in all. No great body of fish appeared in the Gulf until far on in the season, and when they did come the weather was continuously unfavorable, with heavy gales and excessive rainfall, and the fish would not bite. Excepting a few lucky crews it has been a poor year for the hook-and-line fishers. More seining was done by Island fishermen than heretofore and, as a rule, they did fairly. Several new vessels were afloat. The mackerel taken were of good size and quality. Canning of mackerel shows in the returns for only a few hundred cans as against nearly half a million cans last year. A large fleet of American vessels fished off the Island. A reliable correspondent at the Gut of Canso informs me that the exact number of American seiners that passed there on the way to the Bay was 180,

having an average of two seine boats and two seines per schooner. Of these nearly sixty sail returned home about the middle of the season with poor catch. Those who remained did better; in fact, a good many filled up. Notwithstanding unfavorable weather four schooners were reported "high line" having taken respectively, 1,057, 1,600, 900 and 880 barrels. The total catch of the American Bay fleet is given, on Gloucester, U.S., authority, at 26,800 barrels, that is to say, 10,000 barrels more than the whole Island catch.

Contrary to all expectations lobster fishing turned out largely in excess of last year. Packers admit it has been an extraordinary season. Speaking within compass and allowing for exaggeration in the returns, the catch has been, at the least 400,000 cans better than last year; the figures make it 495,282, notwithstanding that ice was a month later in breaking up. The extension of fishing time to 30th August was not of general benefit, many factories, from injury by storms and for other causes, having taken up their traps before that date. Ninety-five factories were in operation. Lobsters were of fair quality, but the average size seems to require five lobsters to fill a 1-pound can.

From stormy weather and for some local reasons oyster fishing has not been quite so actively pursued. Catch, 28,320 barrels, being under that of last year. In the course of the summer I was requested from Germany, for the information of the Germanic Government's Scientific Commission for exploration of the German seas, to make a series of observations on the salinity and temperature of the water in which natural beds of oysters are found in this part of the lower Gulf of St. Lawrence. The information was sought with a view to experimenting on the culture of Canadian oysters (*ostrea Canadensis*) on the coast of Schleswig-Holstein, should the conditions of the water there be suitable. Eighty-two observations were made of water drawn from the principal Island oyster beds at various depths. As our beds are in comparatively shallow water, it was found that the temperature of water varied so little from the air temperature of the hour that no reliable data could be drawn as to the maximum or minimum consistent with oyster life. The readings ranged from 20.5 degrees of the thermometer of Celsius, in August, to 15 degrees in November. Observations on salinity were more definite and seem to establish a range within which oyster growth is assured and outside of which it is problematical. This range is between 14 degrees and 22 degrees of areometer (in one instance 23°). Should further observation confirm this, the knowledge is of the highest importance in laying down beds for artificial culture. Other items of interest were developed in course of the investigation. Late in the season a sample barrel of brood oysters were shipped to Hamburg *via* New York, with a view to test the chances of enduring an Atlantic winter voyage. Receipt has not yet been acknowledged, but should the oysters arrive in good condition it will be an interesting experiment in acclimatization. A full report on the subject was transmitted to the Commission through the Canadian Department of Marine and Fisheries. The instruments used in the investigation were sent from Berlin—L. Steger, Kiel, maker.

Our streams are in good angling condition and well stocked with trout. The product has been large.

The minor fisheries and fishing products call for no special remark.

HERRING.

The state of the herring fishery in this Province deserves observation. It has practically ceased to be a commercial fishery, and has become a mere fishery of bait for other fish. In 1883, which was an exceptionally good year, only about 5,000 barrels were put up as food, out of 45,000 landed, the remainder being used as bait for mackerel, cod and lobsters. This year, of 36,217 barrels, only 7,691 were used as food.

A question arises whether herring are entitled to fishing bounty when used merely as bait for other fish, on which a second bounty is claimed. For instance, bounty was paid, in 1883, on 33,159 barrels of bait herring, equal to 6,631,800 pounds weight, equivalent to 2,655 men's catch, with nothing to show for it, excepting the

catch of mackerel and cod, on which bounty was further paid. This year's claims will be presented on over 5,000,000 pounds weight of herring used wholly as bait, and again on a like quantity of 5,000,000 pounds weight of cod, hake and mackerel, caught by such bait. It may be here mentioned that the wardens' returns set down the number of boats employed in the sea fisheries (exclusive of lobster dories) at 1,163, and the number of men at 3,738, thus giving for each boat, large and small, a crew of very little more than three men regularly at sea.

This year the fish did not come in as usual, within a few days on all parts of the coast alike, but struck the east end of the Island in great abundance, while to the westward they were scarce. Along the whole coast, from North Cape to Campbellton and beyond, usually a good fishing ground, almost none were taken excepting an average at Miminigash and some good hauls off Nail Pond. On the other hand, along the north of King's County they were very numerous and of unusually good quality. While fishing masters on the west were thus straitened in their supply for bait, and had to import cargoes of herring from the Magdalen Islands, Anticosti and elsewhere, fishermen on the east of King's County, especially at Cardigan Bay, were selling surplus herring as bait to the American seiners. At Newport, Lot 54, the fishermen look on this as a business to be pursued in future. From 'Grand River, King's, the warden reports herring sold to the Americans for bait to the extent of \$1,000. In Georgetown harbour the schools were unprecedented, large numbers having been taken around the railway and ferry wharves. The length of nets set this year was 58,417 fathoms.

It will be seen from the above figures that no considerable export is to be looked for until a direct market (in the West Indies, perhaps) shall excite our fishermen to supply the demand for food fish at a higher rate than can be got for bait. When that time comes, and even now, much might be done to increase the catch. With only the above-named fathoms of net—a comparatively small stretch, for our line of coast and bays—no greater results can be anticipated. In British waters drift nets are mainly used, and the shelving, sandy bottom of the Gulf is favourable to their use. This would necessitate the use of larger boats, owned on shares and that could put to sea, two improvements I have always advocated, and of which the fishermen themselves are now beginning to perceive the desirability.

The use of drift nets and seines by our own fishermen would partially remedy a grievance, in which is much cause of complaint, namely, the waste of herring by Americans. Home seines, being so near home, *would utilize all the fish they catch*. Americans come to the Gulf for mackerel only, and throw overboard all else, as they are only fitted with salt and barrels equal to their tonnage capacity of mackerel. The grievance is thus stated by a fisherman of Malpeque, under date of 4th August. "The mode of procedure of our American neighbours who follow the mackerel seining business on our coast is this: When the seiners see a shoal of fish they get into their seine boats and throw their seine around the shoal and *purse her up*. They then get their vessel alongside and begin bailing the fish on the deck of the vessel. When the fish in the shoal are mostly herring they may get 300 barrels at a dip. Probably 20 per cent. of those are mackerel the remainder are herring. They then pick the mackerel out and dump the herring overboard dead—say 240 barrels, and those herrings, when packed, are worth from \$3 to \$4 per barrel. One American captain told the writer, this day, that he was sure he threw 1,000 barrels overboard this season. It does not require much of an adept at figures to compute the loss to our fishery by 200 or 300 sail of vessels, assuming the above as a basis. It is not alone of the fish they destroy we have to complain; but the dead herring they throw overboard feed the cod, lobster and other fish, and prevent them from taking the hook. Take it all in all, it is a bad business." Warden Aylward, in the official report of his district, makes the same complaint. He says, of date 5th December: "American seining is ruining the fishery on our shores. Our own fishermen are always complaining. The seine is thrown around a shoal of fish supposed to be mackerel. It is drawn out of the water and proves to be herring. Then those fish are all dead. They are dumped overboard

and some 300 or 400 barrels of fish go floating about in the sea dead. It is quite common these few summers past." The basis of these complaints is undeniable; a remedy is less easy to provide.

It has been mentioned in previous reports that herring is here altogether a spring fishery, and although fall herring are known to be plenty, within easy reach, and several persons have expressed an intention of fishing them nothing has yet been done in that way. The warden at North Lake, King's, mentions as unusual that this year herring were taken on both sides of East Cape as late as the 10th and 11th of November.

As this report, when published, will probably be read by many of our fishermen a summary of the observations of the Fishery Commission, of which Professor Ewarts was chairman, seems of sufficient interest to fill the space it will occupy, namely: "The herring is not an ocean migrant; he is a local inhabitant of our seas. Herring do not congregate in shoals, save when the spawning season comes on. They stick to certain banks as their annual home, and come to certain spawning grounds to spawn. It is at this latter stage that the great takes are made. If a bank is depopulated by too great slaughter of the inhabitants when they collect to spawn, the future fishery of that same spawning ground, or of its approaches, suffers accordingly. Herring are believed to inhabit banks upon which the depth ranges from 40 to 50 fathoms. Where deeper water intervenes between two such banks, as in some cases it does to 400 or 500 fathoms, it is believed that the herring do not cross the deeper channel, apparently because their food supply is not found in the deeper waters. This explains the fact that where an isolated bank has been over-fished it is not recruited by immigration of herring from other waters. The result of investigations of temperature was to show that the temperature most affected by spawning herring was $52\frac{1}{2}$ degrees of Fahrenheit. In waters which were warmer or colder than this the spawning shoals were not to be found. This discovery of the temperature at which herring spawn is of vast importance to herring fleets. It will give them a clue where to search for shoals, instead of doing so at random, as now. Warmer and colder currents seem to fluctuate, and hence it is that herring are found one year on certain grounds, and in another season are lying some miles away. They seem to have followed the shift of the water of the required temperature." The report adds: "In a year or two we may witness all herring fleets equipped with sounding apparatus for taking temperature; when sounding shows the water to be too cold or too warm, the fleet will move on until they find water of $52\frac{1}{2}$ degrees. Then they may at once begin to look out for a shoal."

GASPERAUX.

More gasperaux have been taken this year than last, but the catch, whether large or small, has ceased to be of importance, except to limited localities. At Vernon River, Tyne Valley, and in a number of other places they are seen but are not fished for. Government, the past spring, made a grant in aid of opening the channel across the beach to the ponds at Point de Roche, Queen's, but the improvement there appears to have been only 115 barrels over the catch of last year.

COD, HAKE AND HADDOCK.

Cod fishing has not been pursued this year with the persistence it deserves. Lobster canning has drawn all available labour within its vortex. In previous reports I have had occasion to express an opinion that the cod, hake and haddock fishery along the coast is the fishery of all others the most reliable and the least subject to fluctuation of prices or other disappointment. Fishermen know precisely to what spot of sea to go for their prey. Hitherto, fishing has been carried too far inshore. Water of 30 fathoms or upwards is not reached until ten or fifteen miles off coast. Our boats rarely go out over four miles. This has been owing to almost all our fishermen being also small farmers, and not liking to be long absent from their hold-

ings, but mainly to the small size and imperfect outfit of their boats. Altogether some improvement in the size of boats is observable, attributable, perhaps, to the prospect of fishing bounty. The fishery continued good as late as the end of October.

Notwithstanding that about 90,000 fathoms of trawls were set this year, the observation of fishermen shows that hook-and-line is an equally reliable and less wasteful method of catch. Experience of those seasons have also shown that cod gill-nets are not successful here, and while thirty-one were in use in 1881, only three, of 150 fathoms in all, were set this year. The small catch of herring for bait was somewhat against the fishery, a good catch of herring and plenty of cod usually going together. The fish were of fair average size and the curing good. Most of the catch was taken within the three-mile limits. A large number of New Brunswick boats fished off the north coast, whose catch should be, but is not, added to the product of Prince Edward Island. The usual complaints reach me against trawlers, but fishing by trawls (that is to say, set lines) is legitimate. A notable omission this year is that no boneless cod or hake was put up, which is the more to be wondered at that the article was acceptable for family use.

These remarks are borne out by the warden at North Cape, who reports: "A large number of New Brunswick boats were fishing cod and hake to the northward and eastward of North Cape; also quite a number of Nova Scotia cod fishers, and they are reported to have done well. I believe those New Brunswick and Nova Scotia fishermen are taking the best of our large fish, *for they fish in deep water*. It is a great mistake our boats are too small to do the same fishing. It is quite a sight to see 50 to 100 of those well equipped boats at anchor in the North Cape cove. Parties should induce some capitalist to start an oil and scrap factory at the North Cape. It would be supplied." I agree with Warden Nelligan's suggestion respecting a manufactory of chemical manure.

HAKE

Are always scarce along the north shore, the principal supplies coming from King's County, east end of the island. The catch has been about equal to that of last year.

It is dangerous to make hasty suggestions, but I have thought over the matter in its bearings and have come to the conclusion that a purely fishing village or settlement of Norwegians or other people skilful in fishing, established by Government aid at a certain part of the north coast of this island, would be a success to those comprising it, and would be an example to our people that fishing is in itself a profession, and more profitable when pursued altogether by itself than when combined with poor attempts at farming. Details will be laid before the Department or Commissioner of Immigration, if required.

MACKEREL.

The season has been a poor one for the hook-and-line fishers, although on the west shore individuals did fairly, and as prices are high, made average wages. From other parts of the shore the reports are not so favorable. At one important fishing station (not necessary at present to specify) it is doubtful if the fishermen, although they fished full time, have taken enough to entitle them to fishing bounty. The fish were very irregular in their movements. A few were taken in herring nets immediately after the breaking-up of the ice, which led to the expectation of a good year. These hopes have not been realized. No great body of fish appeared in the Gulf till well on in August, and the weather was continuously stormy, with heavy gales. Many boats on the north-east of Prince County took next to nothing. To the eastward along the north of Queen's and King's Counties they did better, but even there, was a failure in places, while along the east coast of the island, especially off Cardigan Bay, the catch was fairly good. The complaint was not so much the want of fish as that they would not bite. The small catch of herring made it expensive fishing with imported bait. The quality of the fish was unusually good and size large.

The record of the Americans (taken from the warden's and other returns), was something like this : By the 27th of June quite a large fleet was in the Gulf, mostly along the north coast ; they reported not having seen any schools after passing Cape Breton. There was no body of fish in the bay at this date. On the 29th a few schools, mixed with herring, were seen, and about 350 barrels taken off Souris. Weather for about ten days, fine but cool ; the fishermen surmised the fish were at the bottom spawning. While the vessels were mainly cruising along the north coast, considerable schools were noticed off Georgetown on the south-east, but no seiners were there. Some of the schooners when coming north of Cape Breton had followed heavy bodies of fish, but they were not to be found in the bay and were thought to have gone towards Labrador. On 4th July the crews of fifty vessels, numbering 800 men, celebrated the United States anniversary on shore at Souris in a gay and orderly manner. Up to 14th July no fish were taken, the weather being unfavorable. About the 21st, prospects improved alittle, but up to about the 7th of August the bulk of the fleet had done nothing, and some sixty vessels soon after went home with very little catch. Those who remained later found prospects amend. By the end of August some had filled up. Five did well off West Cape on the 22nd. A body of fish, estimated to be half a mile long, was seen off Malpeque, with several vessels in pursuit, and no doubt good hauls were made. Throughout September the fishing was very fair. One schooner took 267 barrels at one haul, completing her cargo. Between 22nd of September and 6th of October 1,762 barrels were sent by rail from Souris, with doubtless other shipments of which I have no account. Gales continued frequent in July and after August—indeed for three weeks the weather was described as execrable. From about the middle of October the schooners were returning home, and by the end of November only three remained in the bay. The Americans were loud in their complaints that their fishing was a failure, but I cannot learn that any of their fleet went home quite clean.

Complaints have been made, especially from the west of the Island and from Tracadie, that some of the American schooners seining within the three-mile limit carried away lobster-traps and disturbed the lines. Such incidents are somewhat apt to be exaggerated. The most reasonable cause of complaint (already averted to) against American seiners is, that they enclose large bodies of herring, which, as they have no use for, they throw overboard, to the great detriment of the bait fishers. This, which appears well founded, is without remedy ; the Treaty of Washington providing no detailed regulation or police provision of any kind. It seems feasible that our own Island seiners, being so near home, will utilize any herring taken by them in seines and thus, in their own case avoid a like waste and damage.

A published letter from on board the fleet says : " The schooners out of the Island did fairly well for *Islanders* but of course they do not pretend to compete with Yankees." This is a text that may be fairly preached upon. There is no manner of reason why *Islanders* should *not* compete with Yankees, and I am happy to say that this year has shown some effort to do so. Last year there were only thirteen seines owned in the Province ; this year thirty-eight, of 5,600 fathoms, with several new seiners, one of them the "General Gordon" of Souris, of 90 tons. The island tonnage engaged in the sea fisheries this year was forty-seven vessels, 1,764 tons, being largely in excess of previous years. Whether an impetus has been given by the prospect of fishing bounty I am unable definitely to say. At Stanhope, twenty fishermen, formerly hook-and-liners, have united on the principle of joint stock association in the purchase of a seine boat, and a seine of 160 fathoms in length by 40 deep. It is to be hoped their enterprise will be rewarded with success, and that the good example of association for mutual benefit will be generally followed.

It ought to have become apparent to hook-and-line fishers that the day for that primitive method of fishing is over. It is perfectly certain that the seiners will not go back on their tracks, and therefore the liners must come forward, and the sooner the better, for hook-and-line *cannot* compete with the seine. An American seiner would think his fishing a dead failure if he did not fill up at least 300 barrels, to be

divided between fourteen to sixteen hands. This represents a catch of 20 barrels to every man and boy on board, and many schooners, even in this poor year, have taken twice 300. Hook-and-liners can estimate for themselves whether there is much likelihood of their taking 20 to 40 barrels per man with hook-and-line only. Nothing can be more certain than that this quantity as an average year by year has never been reached under the present system of individual fishing.

It may be useful to note the comparative chances of seining and hook-and-line fishing on the same day, at the same locality, which I take from reports from various parts of the Province. In the instances noted both the seiners and line fishers were Islanders:—

Seine.	Hook.
5th August, Tignish. Myrick's schooner done pretty well.	Not much doing.
8th do Stanhope. 100 barrels at one haul. A Nova Scotia schooner enclosed 400 to 500 barrels, but seine broke.	Not much doing.
End of August. Bay generally. Some Americans filled up.	Continue to have hard luck.
22nd August. "Miminigash," "Gordon" and "Gallant" took 14,000 fish at one haul.	No catch of any importance with hook up to date.
2nd September. Off Miminigash. A foreign schooner took 200 barrels close in shore.	Little done past two weeks.
6th September. Schooners doing fairly well along west shore.	Very poor, except a few good days.
7th September. Cardigan. None.	Fair catches. One boat took \$100.
16th September. Malpeque. Doing fairly well.	Absolute failure generally. On East Bay two men in dory hooked 1,000 fish.
9th October. "J. A. Mathieson," Campellton, 200 barrels No. 1, at one haul.	Poor catch.

A remedy for this great disproportion lies in associating for the purpose of procuring modern appliances, as has been done by the Stanhope fishermen.

CANNED GOODS.

The canning of mackerel seems to be laid aside for the present. Last and preceding years showed respectively 229,000 and 430,000 cans; this year only 12,484. I am not well informed as to the cause of this diminution—probably the high price given for barrelled fish.

LOBSTERS.

In the early part of the season there seemed every prospect of a ruinous year for lobster fishing. To the astonishment as well as the satisfaction of packers, the catch has turned out largely in excess of 1883, which was a fair average year. The lobsters were fairly well filled. Estimating from imperfect data, it took an average close on five lobsters, and a small decimal over, to fill a 1-pound can, being about the same as last year. A few $\frac{1}{2}$ pound cans were put up in Prince County in handy form for picnic use.

The record of the fishing is as follow:—Spring was very late in coming and the ice hung long about the coast. The packers had an expensive time in keeping their hands idle for fully the first four weeks of the season. The first lobster caught was on 3rd June. When all hands got to work they partly made up their leeway, for the first "batch" or run of lobster came in quite as fast as they could be utilized. I have noticed this to have been the case in previous years, as if, when ice remained long,

the lobsters congregated in large bodies on the outer edge of the frozen belt, ready to run for the shore as soon as it was clear and the temperature suited. Subsequently the batches fell off to a little less than the average. Throughout the whole of July lobsters were abundant, but frequent gales considerably curtailed the fishing, and, in places, injured the traps. Prospects again seemed unfavorable, and a memorial signed by fifty-eight packers—representing seventy-seven factories—was sent to the Minister, praying for an extension. I was directed to forward an estimate of what the probable catch of the year might be, and placed it at 3,727,000, up to 30th August, which was 600,000 cans short of the mark. Extension was granted to 30th August. Meantime the catch had become better and a good many factories came up to the average of last year. Several shut down before the 30th August, and there did not seem any general desire for a further prolongation of time. It has always been difficult, and is now more so, on account of the fishing bounty, to prevent men, towards the end of the season, from deserting to the mackerel fishery. According to a statement furnished me by Mr. Lydiard, Customs broker, Charlottetown, the quantity exported to date of 3rd December, was:—

	Cans.
To Great Britain.....	2,861,568
United States.....	511,776
Havre	95,856
Hamburg.....	19,200
Amsterdam	9,600

A total of 3,498,000 cans, being 381,028 cans in excess of 1883.

Ninety-five factories (for ninety-seven), were in operation. One was accidentally burned; twelve did not operate; two are in progress of erection, and twenty four new factories are projected for next year.

During the past year forty-one factories have called on the inspector to adjust disputes, and have voluntarily abided by his decisions. Twenty-four other applications are on file, craving for an immediate adjustment preparatory, to making arrangements for next year.

In this connection I have been favoured with copy of an official opinion given by the legal adviser of the Government, in regard to certain circumstances of lobster fishing in the County of Gloucester, New Brunswick, which opinion seems to have been given on the action of a fishery warden there, and respecting which I am ignorant. My attention has also been drawn (though not by the Department) to the high authority of Coulson. Both authorities lay down the principle that the right of fishing in the sea is *prima facie* vested in all subjects of the realm, and the right of fishing therein is free to all as of common right. Coulson adds: "It would appear, by common law, the public have the right of catching in the sea and public rivers all the fish they can by all means which are not inconsistent with the rights of others, but that *any undue interference* with the rights of others is a nuisance and indictable. The right of public fishery, however, includes the right to use lawful nets." As the Fisheries Act places shell fish on the same footing as floating fish the word "nets" logically includes traps. The legal axioms of the sea, thus laid down, are: Sea fishing is open to all, with a common right to the use of the shore. These principles are so well known that they have never been lost sight of by the undersigned, and have never been infringed upon in the fishing waters of Prince Edward Island during his term of office.

Speaking for this Province only, the matter narrows itself to the query: Has a lobster packer a right to set his traps in the sea-front of his factory without being subject to injurious interference? And what constitutes injurious interference?

It is evident there is a misapprehension of the premises by some persons in regard to the matter of lobster trapping in this Province and of the action of the fishery officers in regard to it. The assumption is that an exclusive right of property in a portion of the sea purported to be given. Such not being the case, *imprimis*: all complaints were adjusted by the fishery officers under section 18, sub-s. 5, of the

Fisheries Act, *never under section 13, sub-section 11.* Parties aggrieved by trespass after the inspector had pointed out what would constitute "undue interference" in that particular instance, were referred to their lawyers.

The very wide distinction between "fishing," properly so called, and lobster potting, as in England it is more correctly described, seems to be lost sight of in discussing this matter. Trapping is not fishing. The appliances of fishing, namely nets and lines, are movable; the apparatus of trapping is traps, that is to say "fixed engines," so recognized in British law. It is not claimed that any fishery officer of a Province can lay off a space of sea-room exclusively to any person whatsoever for fishing. One hour one fisherman may throw his net or cast his hook in a piece of sea and next hour somebody else may do the same. This is fishing. Potting or trapping is altogether different.

In lobster trapping—miscalled lobster fishing—an apparatus is anchored for twelve weeks on one spot. A large number of traps (each of which is, in itself, an "apparatus" under the Act), are permanently connected together, so as to cover the given space of sea bottom that is necessary for the trapping of as many lobsters as the factory on shore has been constructed to can. Each of these traps requires a measured space, and is permanently attached to a cable at a longer or shorter distance graduated as necessary to catch lobsters in that particular locality. To save boating, the traps are set as near as possible, so that they be effective. The whole field of, say, 1,000 or more traps, forms one apparatus—one sub-marine fixed engine. Protection to this fixed apparatus can, in no sense, be construed into a fishery grant, or exclusive right of fishing on any area, whether its limits be defined or not. Lobster fishing apparatus permanently anchored at the bottom of the sea interferes with no fishery. Seiners seine over it; hook-and-liners fish over it. It is simply and solely a sub-marine "fixed engine," in the English acceptation of the term, and as such, the Inspector of Fisheries for this Province has regarded it as entitled, under section 18, sub-section 5, of the Fisheries Act, to protection against undue interference.

Each individual trap, as a unit of this complicated system or apparatus of traps, demands a given space to make it operative, and intruding traps set in and among the traps of such system render them inoperative, while a line of trespassing traps set between the apparatus of a factory and the open sea acts as a fence, and prevents the lobsters, coming in from the sea, from reaching said apparatus. Here the vague and misleading phrase, "an equal right to fish," falls to the ground, for no man has any right to injure his neighbor, as the setting of intruding traps among or in front of his would do. It is true such injury is actionable at law, but that is no practical remedy, as is hereafter shown.

Bearing in mind what is sufficiently self-evident, namely, that a large fixed apparatus necessarily occupies a greater base of sea-bottom than a small one, it is manifest that there is no protection whatsoever to apparatus unless the required base for the proper working of such apparatus is guarded against trespass upon it by similar apparatus. It is in this sense, and in this sense only, that the inspector, when called on by the parties interested, and only when so called, has adjusted the space required by adjoining apparatus, so that neither might interfere with the other. This is nothing like a "grant of fishery." In the supposable case, that one factory increased and the adjoining factory diminished the number of their respective traps, a re-adjustment would be made, on the sole basis of preventing undue interference, and of giving a proportionate chance of success, by preventing trespass of traps upon each other. No superfluous space has ever been assigned, and any space not actually occupied with trap apparatus, has been regarded as vacant.

I may say, advisedly, that the arrangement hitherto pursued has acted well in this Province. Without some adjustment, giving security against injurious interference, it is most certain that the industry will fall into inextricable confusion.

Without definite and reliable protection of its trapping apparatus, any factory, built at large expense, may be rendered valueless, without practical recourse. Adventurers, without conscience or capital—of whom there are more than plenty—can run

up a shanty a few yards off, and mix up their traps among those of legitimate establishments, under the vaguely expressed claim of "equal right of fishing." A few lath or hoop traps and some coils of rope are all that are required to do mischief. An action at law is here useless; it provides no real remedy. A suit at law would be protracted by an appeal—never intended to be prosecuted—and meantime the intruder would continue trapping until the close of the season, and then disappear, or, if found, not be worth the cost. This is not a mere supposed case. To prevent such undue interference, producing, as it does, serious loss to the legitimate packers, and continual quarrelling among the fishermen, section 18, sub-section 5, of the Act, has been made use of here and has been received with acceptance. And to sum up briefly: The action of the Prince Edward Island fishery officers hitherto (as above set forth) has been limited to a settlement of disputes as to established apparatus, which, in my humble opinion, is consonant with both the letter and spirit of the Act.

On 29th of October I had instructions from the Department to state views and suggestions, based on the state of the lobster fishery in Prince Edward Island, for information of the Minister. Pending his decision, the suggestions I had the honor to make are not set forth in this report.

Accompanying the present report, but not forming part of it, are two appendices. Appendix No. 1 gives a list of the lobster factories in this Province—showing ninety-seven factories in operation the past year, with, by approximation, 93,800 traps—a number that, if set at 10 yards apart, would environ the whole island. Appendix No. 2 shows the number, year by year, of lobsters slaughtered in island waters since 1st of July, 1873, and foots up a massacre of 132,000,000.

OYSTERS.

The knowledge gained by certain observations elsewhere referred to, should be of great value in laying down oyster beds, for artificial culture, in localities of the island waters wherein natural beds are not found. Our whole shore is fringed with creeks and estuaries, wherein oyster farming might be successfully and profitably carried on. The requirements of shelter, absence of excessive tide, suitable bottom, and the proper degree of salinity are everywhere.

In several previous annual reports I have respectfully drawn the notice of the Government to the desirability of putting the fast-decaying oyster fishery of this Province under due regulations. It is unnecessary again to go over the arguments, but I may mention that several applications are on file with the Department for lease of stations on which to attempt the culture of oysters. Were the inspector directed to survey and lay off as oyster farms, and offer for lease a few experimental stations, it is believed they would be readily taken up. Section 15, sub-sections 4 and 5 of the Fisheries Act, gives the Minister power to authorize this, as also to expend parliamentary grants in stocking localities now oysterless. I beg to refer to last year's report for a suggestion to plant a small model oyster farm in each of the three counties; and I would beg to renew that recommendation, at least with reference to King's County, and would suggest Cardigan as a suitable locality.

There are a few facts with reference to existing natural beds that are to be taken into account. Many parts of the bottom of creeks and estuaries are of hard "mud" (so called), formed by the disintegration of sandstone mixed with washings of underlying clay, until of the consistence of brick paste, with but little vegetation. No better bottom could be found for the laying down of brood. In other places are deposits of shells, where oysters once were, but are not now, which is also good bottom for planting. The main requisite for good bottom is that it shall give a foot-hold for ready attachment, and be so firm that when the oyster opens its shell no washings or impurities may flow into the animal. Hence the use of tiles in oyster culture in Europe. Broken shells and projections of the clay offer, in this island, the same conditions as the artificial trays and made-floors of Europe. On these ready points and projections the "spat" or spawn, emitted from the brood oysters, catches and adheres. I do not think the spat has sufficient vitality to drift to long distances.

The minute young must be most delicate, much more so than the young of swimming fish. A favorite resting place of the spat is on the edge of the laminae of old shells. There once established, the young oysters grow in clusters, to the dimensions say, of 2 inches in length the first year. Thereafter the growth is proportionately more rapid, until at four years they come into market. It is a noticeable fact that all the oysters in a cluster do not grow on the same plane, with the inferior (flat) shell downwards and horizontally, but grow perpendicularly or at all lesser angles, the arrangement evidently being that each individual oyster shall grow with reference to the others, so as to have the largest facility for opening its shell. In this circumstance is a key to the destruction, from natural causes, of self-planted oyster beds. Thus, when the oysters in a cluster come to maturity, and in due course of time themselves emit spawn, such spawn or spat is caught on the ragged points and edges of the parent shell, forming a second growth above and upon the first. The process of stratum growing on stratum, floor upon floor, goes on increasing the bed in height each year, while, at the same time, the base is being extended, until the mass becomes a mound of oysters, sometimes of large area. The inner strata of this mass, being, from the superincumbent pressure, unable to open their shells, perish from suffocation, so that the mound comes to consist of a core of dead shells, with a thin covering of live oysters on the top. Where the mound, by annual increase, grows so high as to reach the ice-line, even that thin covering of oysters is killed. Moreover, these oyster-banks in the channels collect ooze, mussels and rubbish, tending still further to destroy the bed, until sooner or later it perishes. This destruction would be prevented by artificial culture in removing obstructions, raking the beds, preventing too thick a growth, and shifting the growing oysters into new water two or three times before they come to market. By such culture all waste is avoided and a much superior article produced.

These natural causes sufficiently account for the rapid deterioration of our oyster beds without the added destruction of digging them up for farm manure. Notwithstanding these depressing agencies, 28,320 barrels were this year sent to market, mostly in Canada. It will be observed that all our oysters are what are known in Europe as "sea oysters," that is to say, oysters that are taken from natural beds *in situ* and which, as their shells are rough and unshapely, fetch a much less price than the oysters of cultivation, the shells of which are thinner, smoother and more symmetrical. Two forms of oyster are found growing indiscriminately on the Prince Edward Island beds, namely, the long Canadian oyster and, in a lesser proportion, oysters circular in form. I am not naturalist enough to decide whether these are different varieties or merely variations in form.

The time seems to have come to open the oyster grounds—or a part of them—to lease, under due regulation. As matters at present stand, no one will venture the risk of artificial cultivation. The present state of the law and the custom of the country are exceedingly indefinite and unsatisfactory. It is doubtful if the law would protect private oyster beds from being robbed, under the guise of shell-digging. Hence the necessity for the area of artificial culture being secured by lease or grant, or by being set aside for the public interest. In last year's report I submitted details that, I think, would meet the case, and to which I beg to refer.

The fishery has not being so steadily pursued this year, owing to continued bad weather, which readily agitates the shallow water in which oysters are found. A number of oyster fishers have removed from Percival Bay, which has generally given a good yield. Two hundred boats were regularly employed oyster fishing on Richmond Bay. Twenty-four barrels are reported from St. Peter's, a new locality.

FRESHWATER FISHERIES.

Our streams are in excellent condition, well stocked with trout and offering fair pastime to anglers. Brook trout of 2 pounds, and sea trout of 3, 3½ and one of close on 4 pounds are mentioned. Netting is almost extinguished, the river wardens deserving credit for their watchfulness. The few remaining poachers confine themselves to

the more dastardly crime of spearing salmon, but even this is on a small scale and every possible precaution is taken against it. Sawdust is still the great trouble of the fishery officers, but it is checked wherever practicable; 44,880 pounds weight of fair trout taken legitimately by angling, in one season, is a creditable show for our small streams. I do not consider these 22 tons of trout as over fishing.

Several anglers from the United States have visited our trout streams the past season and have generally had good sport, and there is a welcome for more. No elaborate or expensive outfit is required. A medium rod of all-work (as our streams are small), and for flies, mayfly, winged hackles, cinnamon, ibis, professor and coachman (see Barnwell's *Game Fish of the North*, page 17, Carleton, N.Y., publisher) are all that are required. The country districts of the Province are destitute of hotel or tavern accommodation, but hospitable quarters can be obtained for the most moderate remuneration. The Island is easily reached by passenger steamer and a railway runs the whole length, leaving but a very few miles to tramp or drive from any station to the fishing ground. An angling trip to Prince Edward Island is among the least expensive of summer tours.

In several of the waters in which salmon fry were deposited they are taken by fly as samlets. We have no means of ascertaining the comparative growth or mortality of these young fish, excepting by casual chances. It would cost no large expense to construct, near the hatchery or under the immediate eye of the inspector, an experimental pond, through which a brook could be led and a series of observations be noted of their development in that basin. No further cost need be incurred for these observations—the interest of the experiment should be its recompense.

Overseer Henry Clark, manager of the salmon hatchery on Dunk River, has been successful in obtaining ova to nearly the capacity of the establishment. Gravelly beds in the river offer the fish a temptation to spawn before coming up to the hatchery. Were these beds ploughed up, which could be done at trifling cost, the great body of fish would come to the hatchery itself, and thus give a certainty of ample supply. At the date of this report 1,250,000 eggs are on the trays and apparently doing well. This was the produce of 160 females, 7,500 each—sixty males. Salmon are reported abundant in the streams they frequent. No complaint has been made this year of injury to the streams from starch factories.

Smelts are in standing abundance in the mouth of all brooks in spring, as well as under the ice in winter, but until last year, when a small experimental shipment was made to Boston, were only used for domestic relish. It is understood the shipment paid expenses, although it arrived when the market was low. This year thirty-four boxes were shipped as a further test.

Fish-ways in this Island, where our streams are little more than large brooks, running a short course, are of less necessity than on the mainland, where the water-courses are rivers. The wardens have strict orders to see that the waterways are kept clear, and to remove obstructions from the foot of the slides. One fish-pass on Trout River, Prince County, in aid of which a grant of \$35 was made, is still in an unsatisfactory condition and will be repaired at the expense of the mill owners.

OTHER MATTERS.

Eels show a considerable value. It continues strange that the Island eels, being of the best quality, do not find a market in some shape. It is also strange that no herring are smoked. Eleven small boxes are all that are given, yet imported boxes, of no better quality, sell readily for domestic use.

That excellent fish, the striped sea-bass, is supposed to be in plenty off the shore, but it is seldom caught, from not being specially fished for. At one time a considerable number, say in weight 3 to 7 pounds, were annually taken at Miminigash, Prince County, the only place where they were specially sought, but, for the past year or two logs have prevented their access. Warden McKenzie mentions the capture of a few south of Queen's, where they were not previously taken.

The past two years a very few shad have been taken chiefly in the trap at Tignish, Prince. If it be true that these fish are not known to spawn north of the Bay of Fundy, it would be interesting to know how they have spread into the Gulf.

In cod-fishing some halibut are taken; this year about three tons, the largest fish weighing 400 pounds, and measuring $8\frac{1}{2}$ feet in length.

There is no means, except by estimate, of arriving at the quantity of fresh food fish used, apart from the regular fishing as given in the returns. Probably 150,000 pounds, at 3 cents per pound, is a close approximation for the 15,000 families of the census.

Fish oil shows 13,000 gallons, mostly of a quality superior to common, as it is cold-drawn and not expressed by heat. One quintal of cod gives about one gallon of oil. No dogfish oil made

Cod and hake sounds form an article of commerce this year, to the value of \$8,000, being less than usual. In some instances, however, they are not saved.

A Hamburg mercantile house, with a branch at Chicago, has been making enquiry respecting sturgeon, with a view to the manufacture of caviare. Sturgeon are on this coast, but are never seen, excepting when a stray one, of small size, is found entangled in nets.

No fish guano is manufactured, but a large quantity of lobster offal is carted away by farmers as manure; 2,000 tons is not too large a computation. There is abundance of raw material for the manufacture of fish or chemical manure on a considerable scale; there might be difficulty in collecting it.

All offences against the Fishery Act that have been brought to my knowledge have been dealt with as set forth in the returns of fines and forfeitures.

Of this date, in the letter to the Department, I have drawn attention to the large increase in duty demanded of certain fishery wardens from the increase of lobster factories.

I have the honour to be, Sir,

Your most obedient servant,

J. HUNTER DUVAR,

Inspector of Fisheries, Prince Edward Island.

APPENDIX No. 1.

J. HUNTER DUVAR,
Inspector of Fisheries, P.E.I.

No. 7.

BRITISH COLUMBIA.

NEW WESTMINSTER, 9th February, 1885.

The Honorable A. W. McLELAN,
Minister of Marine and Fisheries, Ottawa.

SIR,—I have the honour to forward herewith the statistics of the yield of the fisheries in British Columbia for the year 1884, and beg to report as follows :—

1. The returns show a decrease from last year, amounting to \$286,378.32. This decrease falls chiefly on the salmon pack on the Fraser River, numbering 55,050 cases less than last year. As will be seen by the returns, only six (6) canneries out of thirteen (13) operated during the season. This was owing, not only to the periodical short run of the suck-kie, but to the large quantity of tinned salmon on the market and the low prices obtained.

2. The following extract is taken from the review made on the canning trade of the year 1884 by the *San Francisco Chronicle*, viz. :—

“There is estimated to be over in Great Britain now—1st January, 1885—in an unsalable condition, pressing on the market like a load on a dyspeptic’s stomach, over two hundred thousand (200,000) cases of fall salmon, that will not bring much more than freight, insurance and charges.”

3. A good deal of bad fish has, no doubt, been put up through the hurried and imperfect packing during the last part of the season, when there has been a tremendous run of fish, a thing which occurs periodically in the Fraser River. In future, no doubt, the canners will be more careful, as they now see the bad result of putting up inferior fish, &c., &c. Each firm, I now hope, will endeavor to produce such an article as will please their customers, and tend to increase the canned salmon trade of this Province.

4. The proportion of salmon packed by the several canneries on the Fraser, and the canneries on the northern coast, are as follows, viz. :—

	Cases.
Fraser River, six (6) canneries.....	38,437
Northern coast, eleven (11) canneries.....	102,805
Total cases, 4 doz. 1 lb. cans each.....	141,242
Representing an aggregate of.....	6,779,616 lbs.

Of this pack the following shipments are recorded :—

	Cases.
Per “Harvest Home,” for London.....	16,820
Per “Frederick P. Lichfield,” for London.....	34,532
Per “Estrella-de-Chile,” for London.....	25,516
— — — — —	76,868
Australia.....	13,791
Canada, E.....	30,463
Overland and destination unknown.....	14,176
On hand, including home consumption.....	5,944
Total number of cases.....	141,242

5. Through some unknown cause, the herring, although plentiful in the Gulf of Georgia, did not enter the Narrows at Burrard Inlet as usual, in sufficient quantities to justify the working of Mr. J. Spratt's oil and scrap manufactory.

This energetic gentleman has, during the past year, expended in further improved machinery, at Cove Harbour, upwards of \$20,000, to more effectually extract the oil from fish, and in the manufacture of scrap from the offal. Next year (1885) he intends to collect from the canneries on the Fraser River the salmon offal and convey it to his factory for the above purpose. In the event of this attempt proving a success, it would be advisable to prohibit any fish offal from being passed into the Fraser River, which no doubt is objectionable.

6. The fish scrap manufactured by Mr. Spratt is of superior quality; I tested it, and found that the acre of land manured with it yielded nearly double of the acre planted with like crop without manure.

7. A whale fishery is about to be established in the Gulf of Georgia, which, I have every reason to believe, will prove a great commercial success.

8. The demand for sturgeon is largely on the increase. This fish reaches to an almost incredible size in these waters; the largest captured this year weighed over 800 pounds. They have been caught up to 1,400 pounds.

James G. Swan, Esq., the Assistant United States Fish Commissioner, stationed at Port Townsend, in Washington Territory, in a letter to the Port Townsend *Weekly Argus*, on his visit to New Westminster, on the 16th ultimo, says, in describing the size of the Fraser River sturgeon: "This may sound like a fish story to those who never saw a fish bigger than a salmon, but there is no reason to doubt the truth of the statement, the great sturgeon of the Danube often exceeds 1,000 pounds, and the Fraser River sturgeon equals them in size."

Mr. Gauthier, of Detroit, Ont., and others, on the completion of the Canadian Pacific Railway, intend packing this fish, together with other kinds, in ice, and exporting same to the North-West by rail.

9. The business of importing oysters for culture from eastern Canada is still in abeyance.

I received a letter from the Secretary of the Mud Bay Oyster Company, dated 21st ultimo, in reply to enquiries made, as follows:—

"I have the honour to state for your information that the company sent me to San Francisco, last January, for the purpose of making arrangements to obtain a supply of eastern oysters; but, as the results after full, careful and complete enquiry, we found that the expense of obtaining oysters on the American lines would be too great to leave any margin of profit. When the Canadian Pacific Railway is finished, oysters can be imported at reasonable rates, and we trust that you will recommend the Honorable the Minister of Marine and Fisheries to grant us leave to delay until we can import oysters at a reasonable rate."

I therefore beg to recommend that their application may receive your most favorable consideration, as I am confident that as soon as transit can be made direct from eastern Canada the company will import a large stock of young oysters for planting at Mud Bay.

Mr. A. J. McLellan who obtained oysters from New York, and planted them in certain tidal waters of which he holds a lease, reports that the oysters are doing well at present, but he cannot state clearly about their spawning. A large amount of spat have attached themselves to all clean objects, and are now about the size of a 10-cent piece. Whether they are the offspring of native oysters or of those he imported from New York he cannot determine. He says: "The probability is that the native oysters have propagated in thousands, on account of imported oysters acting as clean stools for the native spat. The imported oysters are too young to emit spat until next year, when I hope to meet with good results. The sales have been very limited. I imported, 76 barrels of young oysters and 20 barrels of marketable ones; of the latter I have only sold 10 barrels, at \$20 per barrel. I am sorry I cannot give you more solid information in regard to the breeding, as this is the

important point. The large oysters I imported might have emitted spat, but I shall not be able to tell until next year."

Mr. John McLeod, of Sanich, Vancouver Island, applied for a lease of a part of the west shore of Sanich Inlet, Vancouver Island, for oyster culture, but as he has not replied to questions as to whether the granting of said lease would interfere with any vested rights, I have not forwarded the application.

10. C. B. Bagster, Esq., writing from Charlottetown, P.E.I., for information respecting the temperature of the Japan current which circulates through the British Columbia islands, as he is preparing a paper on the propagation of the lobster, not having any statistics to refer to, I wrote to Capt. J. Devereaux, commanding the Dominion Government steamer "Sir James Douglas," asking for the desired information, who, very kindly, sent me a very comprehensive statement, a copy of which is appended.

11. The fishermen of the Province are well conducted, peaceable and orderly; very few offences against the Fisheries Act were detected, although a strict supervision has been kept up. In each case suitable fines were inflicted.

12. In conclusion, I may say the outlook of the fishery industry of British Columbia is very promising, and ere long will be of great commercial value.

I have the honour to be, Sir,

Your obedient servant,

G. PITTENDRIGH,

Inspector of Fisheries for British Columbia.

STEAMER "SIR JAMES DOUGLAS,"

VICTORIA, 30th January, 1885.

MY DEAR CAPTAIN PITTENDRIGH,—In answer to your letter of the 27th instant, respecting the temperature, &c., of the water along these shores, I fear we are in great lack of reliable information on the subject; but, however, I will do all I can to assist you. Owing to the want of a thoroughly organized scientific survey and the comparatively recent time this coast has been settled, not much attention has hitherto been given to this subject, and all I know is from private observations taken by me as an amateur.

Some years ago I found the Kwra Tuva, or Japan current, at the south end of Kensin and, near the Loo-Choo Islands, in lat. 30° N. and long. 130° E., to be from 80° to 84° Fahr.; thence I have traced it eastward, varying downward from 70° to 60° in lat. 50° N. and long. 130° W., where the depth would possibly be 800 fathoms—and here I found the stream distinctly marked with dividing or partition walls, and abrupt changes in temperature; and now comes the difficulty, for where these waters go or what course the currents take after reaching the coast is a problem not solved. In my opinion they disperse, and are diffused all over the coast. Others will tell you this is only an hypothesis—and, in effect, illusory—for warm water being lighter than cold would float on the surface, and there be discovered by everybody. Now, this is not a scientific fact, for water only increases its weight and density until it reaches the temperature of 40° Fahr.; after that it becomes lighter and lighter the colder it gets, thereby protecting, as with a mantle, the warm water underneath from losing its caloric. Were it otherwise, the ocean would freeze to its depths, and once in that state would never again thaw, and the world and all animal life become dead. Now, as I have already said, I believe these waters are diffused all over the coasts of British Columbia and Alaska, for they cannot find their way out of the North Pacific until they have found their level, and thereby raise the atmospheric temperature on this coast. For, be it observed, that we never have a cold snap here only with the wind at N.E., in which quarter it has a clear sweep round the north end of the Rocky Mountains and brings with it the low temperature from the northern regions.

The bank of soundings on the west coast of British Columbia extends from the boundaries of Alaska to Cape Flattery, in Washington Territory, a distance of over 500 miles, and varying from 12 to 45 miles off shore. These banks are more or less the abode of deep-sea fish, and along their outer edges the fur seal feeds in spring and part of summer, and then disappears, and also down the slope of these banks descends the salmon of our rivers to regions unknown, again to reappear in due season; and, to conclude, I have to say that, in all my experience over these banks, and in the inland waters and islets, of which we have a coast line of 7,500 miles, I have never found the temperature of the water, at from 2 to 4 fathoms below the surface, less than 44° Fahr., and sometimes as high as 50°, with the thermometer in the open air at 16° Fahr.

Any more reliable information must of necessity be collected by a series of observations taken at different positions along the coast.

JOHN DEVEREUX,

Commander.

The last temperatures were taken at depths varying from 5 to 6 fathoms, but always below the surface.

NOTE.—The apparent falling off in this division is due to the fact that part of Overseer Wilson's returns are included in the Manitoulin Island Division.

Overseer James Dickson, who has charge of that portion of the coast of Lake Superior extending from Pigeon River to the Slate Islands, reports that, although eight stations were unfinished, the yield of the fisheries in his division is almost equal to that of last year. Several fishermen who left too early missed the last and best run of whitefish, which was unusually abundant, especially in Thunder Bay and in the neighbourhood of Port Arthur. Resident fishermen were highly successful, as whitefish remained on the ground until the 17th December, when the ice compelled them to quit fishing. Two pound nets were licensed, but only one was fished, with very poor results. A large percentage of the fish caught in this division was sold fresh to Canadian Pacific Railway contractors, or sent to United States markets; thus saving the cost of handling, pickling and barrelling.

Overseer Jos. Wilson, whose district extends from the Slate Islands, on Lake Superior, to Collin's Inlet, on Georgian Bay, reports a falling off in the yield of the fisheries of his division. Very few fish were caught after 1st November. Angling for speckled trout in Nepigon River was as good as ever. Pound net fishing met with very indifferent success. Overseer Wilson is strongly opposed to the indiscriminate use of pound nets. He says: "From all the information I could obtain, as well as from my own observations, I am of opinion that in using pound nets we will, in a few years, ruin our valuable fisheries, and I would most respectfully suggest that they be prohibited, except for the taking of pickerel, sturgeon and pike, and only in localities unfrequented by whitefish or salmon trout. Pound nets should be set at least five miles apart and the fee raised to \$50 per net. The clause of the Fisheries Act which fixes the size of gill nets at 5 inches, extension measure, should be strictly enforced."

MANITOULIN ISLAND DIVISION.

Value	\$	1,198,400	111,953 16	147,620 70	296,551 67

NOTE.—The increase in this division is due to the addition of part of Overseer Wilson's returns, as explained above.

Overseer D. A. Cameron, who has charge of the fishing grounds around Manitoulin, St. Joseph, Cockburn and the Ducks' Islands, reports an increase in the catch of whitefish and salmon trout over 1883. This, he attributes to a more vigorous prosecution of gill net fishing. Pound net fishing was not so successful as last year, owing to stormy weather and contrary winds. A falling off is noticed in the yield of pickerel and sturgeon, which this Overseer ascribes to excessive fishing in previous years. The close-season was well observed.

GEORGIAN BAY DIVISION.

COMPARATIVE Statement of the yield and value of the Fisheries of this Division.

Overseer Solomon James, whose division extends from Collin's Inlet to Parry Sound, on Georgian Bay, reports that, owing to very stormy weather, he was prevented from visiting his division before the fishermen had left, but that he is under the impression they gave returns of their catch to the neighboring Overseers, Messrs. F. M. G. Fraser and S. Frazer.

Overseer F. M. G. Fraser, whose division comprises the coast of Georgian Bay extending from Parry Sound to Victoria Harbour, states he experienced great difficulties in obtaining correct returns of the catch of each fisherman. He complains that, some boats are in the habit of throwing the offals of fish in the water on their way to harbours, and that this practice cannot fail but being very injurious to fishing. Two parties were fined \$50 each for throwing sawdust into Muskoka and Coldwater Rivers.

Overseer George R. Steele, who has charge of the inland waters of Parry Sound District, reports that, while the coarser kinds of fish seem to be on the increase, the finer grades are falling off. This state of things he attributes to the want of efficient fish-ways, so as to allow the passage of fish to their breeding grounds. Three parties were prosecuted and fined for illegal net fishing. Their nets were confiscated.

Overseer S. Frazer has charge of that part of the coast of Georgian Bay extending from Victoria Harbour to Allenwood, including the Penetanguishene Peninsula, Christian, Beckwith and Hope Islands. He also complains of the difficulty of obtaining reliable returns of the catch of fish, owing to the reluctance of dealers to supply information. He reports the fishing season as having been unusually stormy, and that several fishermen lost the greater part of their nets. During the beginning of the season, fish were scarce. The fishing grounds around Christian Island were reserved for the breeding of fish. No violations of the fishery laws were brought under this Overseer's notice.

Overseer Geo. S. Miller's division extends from Owen Sound to Cape Hurd. He sends no report, but his statistical returns show a fair increase in the catch of salmon trout and whitefish, whilst the yield of coarse fish does not appear to have been so large as in 1883.

Value..... \$	166,499	135,250	163,996 40

Overseer James Muir's division comprises that part of the coast of Lake Huron extending from Cape Hurd to Point Clark. He reports that, fishing operations were not so successful as they should have been, owing to the stormy weather which prevailed during the latter part of the season, destroying a large number of nets and

otherwise causing serious loss to fishermen. Although fish were scarce at the beginning of the season, they increased during the latter months. Seining at Sauble Beach was not so good as usual. Fishing was also poor around Whitefish and Burk's Islands. The close-season was well observed; the more so as it was too stormy during that period to attempt setting any nets.

Overseer A. C. McKinnon has charge of that part of the coast extending from Point Clark downwards to Kettle Point. He reports a decrease in the catch of fish as compared with the previous year. This he attributes to protracted stormy weather, and to a less vigorous prosecution of fishing, rather than to any scarcity of fish. The demand for fresh fish is steadily increasing in United States as well as in home markets; better prices are obtained, and the cost of handling and pickling is thus saved. Mostly all fishermen now understand the importance of maintaining their business, and realize that it is in their interest to protect the fish during their spawning seasons. No violation of the law came under this Overseer's notice.

Overseer David McMaster attends to the St. Clair River. He reports a great falling off in whitefish and salmon trout; in fact, the quantity caught was a mere trifle as compared to that of previous years. Pickerel also shows a decrease, but this is explained by the fact that, owing to the early breaking up of the ice, the first run of fish went up before the end of the close-season. The catch of herring and sturgeon are largely in excess of that of 1883. The price of pickled herring was, unfortunately, low. The large catch of sturgeon is worthy of notice. Some years ago these fish were considered as worthless, and even deemed a nuisance. They are now reckoned amongst the most valuable kinds of fish frequenting the waters of Ontario. When sold round, fishermen easily obtain 60 cents per fish. When dressed, nothing is lost: the flesh sells at 4 or 5 cents a pound; the prepared eggs, or caviare, fetch 10 cents a pound; bladders 5 cents each. Valuable oil is also extracted from the offals, and the skin is now used for mill-belt laces. Experiments have shown that a set of sturgeon leather laces will last as long as the belt itself. Alleged reports of illegal fishing for whitefish during the close season proved, upon enquiry, to be totally groundless.

Overseer Hugh McFayden reports trout plentiful on the Saugeen River, where they fetch good prices. Two millowners were fined for allowing sawdust to escape from their mills. The close-season was well observed.

Overseer T. McQueen, at the mouth of the Thames River, reports twenty-one grounds as fished in his division during the season, employing 168 persons. Owing to an early spring the catch greatly exceeds that of 1883. No violations of the law came under this officer's notice.

Overseer Angus Brady, who attends to the middle portion of the Thames River, reports a considerable increase over last year's catch, notwithstanding the fact that spring freshets interfered with fishermen's operations during the best run of fish. Prices also ruled higher than usual. The close-season was well observed. This officer destroyed two dip-nets which he found set during the close time.

Overseer Peter McCann, who has charge of the upper division of the Thames River, states that pickerel fishing was fair; coarse fish were also more abundant than during the previous year. The catch of bass was short. Extensive illegal fishing was indulged in during the spring months. Thirteen offenders were brought before the magistrate, and were all fined, with the exception of one. All the fish-ways in his district are reported to be in good repair; another one will be built soon.

DETROIT RIVER DIVISION.

Overseer E. Boismier, who has charge of the Detroit River, reports the catch of whitefish as being better than that of last year. The yield of herring and sturgeon was also more than double. Pickerel shows a falling off. It is feared that the supply of these fish will not stand the heavy drain made on them by the numerous pound nets set on the United States side of Lake St. Clair and Detroit River. Mr. Boismier recommends adopting a minimum mesh of 4 inches in the "pot" for pound nets.

Overseer Wm. Prosser, whose divisions extends from the mouth of Detroit River to the county line of Kent, reports a further falling off in the catch of whitefish as compared with that of 1883, which was considered a poor year. Pickerel and sturgeon also show a decrease, but the good catch of herring and bass makes up for the deficiency, and the total value exceeds that of the previous season.

Overseer J. McMichael's division comprises the Lake Erie frontage of the County of Kent. He reports an increase in the yield of fish, and attributes it to the fact that a greater number of men were engaged in this industry. Several pound nets were destroyed by the storms which raged towards the end of the fishing season. The close season was well observed.

Overseer Alex. McBride, who has charge of that part of the coast of Lake Erie fronting on the County of Elgin, reports that the yield of fish in his division is in excess of that of last year. No violations of the law came under his notice.

Overseer David Sharp, whose division comprises that part of the coast of Lake Erie fronting on County of Norfolk, made no report, but his tabular statements show the yield to be about the same as last year.

Overseer McCrae, who has charge of the Grand River and of the waters of Lake Erie, near its mouth, reports a falling off in the quantity of fish caught. Owing to a late breaking up of the ice in the river, there was hardly any seining done before the close-season. Anglers enjoyed good sport below the dam at Dunnville, but fish were scarce above the dam. This confirms the opinion that the fish-way at that point is either defective or badly located. The attention of the Department of Public Works has been called to the matter.

NIAGARA RIVER AND LAKE ONTARIO DIVISIONS.

COMPARATIVE Statement of the yield and value of the Fisheries in these Divisions.

Overseer J. W. Kerr, whose large district extends from the mouth of Grand River, on Lake Erie, to Whitby Harbour, on Lake Ontario, including the Niagara River, reports that last season's fishing was, on the whole, satisfactory. The catch of herring largely exceeded that of the previous year; the fish being most plentiful between Bronté and Queenston. Whitefish yielded less than in 1883, which was considered a poor year. The catch of this fish was, in fact, so trifling, that it is doubtful whether fishermen will again risk material and capital in its pursuit. Salmon trout are also on the decrease. Sturgeon fishermen on the Niagara River were very successful. Coarse fish are getting to be in good demand, and prove remunerative to farmers, who catch them during the spring freshets. Angling and trolling, specially in Burlington Bay and Niagara River, were very good.

Overseer Chs. Gilchrist reports a complete failure in the catch of whitefish in that part of Lake Ontario fronting on the County of Northumberland, which he is unable to account for. The yield of salmon trout was fair. More coarse fish were caught than during the year 1883. In Rice Lake and tributary streams, angling was better than for many years past. Fewer American sportsmen visited Rice Lake last season, owing, undoubtedly, to the excitement of the Presidential election. About 600 angling permits were issued—forty-four to United States citizens; the balance to settlers and Indians.

PRINCE EDWARD AND BAY OF QUINTÉ DIVISIONS.

COMPARATIVE Statement of the yield and value of Fisheries in these Divisions.

Value..... \$	42,466	62,507	64,949

Overseer C. Wilkins states that the yield of fish in Bay of Quinté largely exceeded that of any previous five years. The increase in the catch of whitefish and salmon trout was especially noticeable, and is undoubtedly due to the removal of nets from the upper gap; thus allowing the fish a free and uninterrupted passage from Lake Ontario to the Bay of Quinté. There are fifteen fish-ways in this division, which are said to be in good condition.

Overseer J. Redmond, of the County of Prince Edward, reports a slight falling off in the catch of whitefish and salmon trout, which he attributes to excessive netting in previous years, and to the millions of worthless small fish which infest these waters. Sturgeon were plentiful, and a good catch was made. The close-season was generally well kept.

LENNOX, ADDINGTON AND FRONTENAC DIVISIONS.

COMPARATIVE Statement of the yield and value of the Fisheries in this Division.

Kinds of Fish.	1882.	1883.	1884.

Overseer A. D. Sills, who has charge of the lake shore and inland waters of the County of Lennox and Addington, reports fish as being more plentiful in his division than for the last ten years. He ascribes this satisfactory result to a close observance of the fishery laws and regulations.

Overseer J. A. Cameron, of Westport, reports a good increase in the catch of whitefish and a decrease in that of trout. Coarse fish yielded about the same as last year, although farmers only fish for them after their spring work is over. He seized a set of hoop-nets in Birch Lake. With this exception, no breach of the law came under his notice.

Overseer R. Gilbert has charge of the inland waters of the Townships of Palmerston, Clarendon, North and South Canonto and Miller, in the County of Frontenac. He reports a considerable increase in the catch of fish in his division, which he attributes to the fact that the number of settlers is increasing. Attempts at spearing were made by hunters camped near the lakes, but being closely watched they did not succeed in violating the law. Most of the trout in this division had done spawning before 1st November.

Overseer H. R. Purcell has charge of the waters in the Townships of Camden, Portland, Loughboro', Sheffield and Kennebec, County of Addington. He reports an increased catch of fish. There are some beautiful lakes in this district, well stocked with salmon trout, whitefish, pickerel, &c. The close-seasons are said to have been well observed.

WOLFE ISLAND AND KINGSTON DIVISIONS.

COMPARATIVE Statement of the yield and value of the Fisheries in these Divisions.

Value..... \$	5,148 00	4,614 00	5,277 00

Overseer Thos. Merritt, of Kingston, reports that since the prohibition of gill nets, the increase in the finer grades of fish is noticeable in the waters of the Bay of Quinté. This is also true of the lakes in rear of Kingston. Large catches of Black Bass are reported on the grounds reserved for angling in the neighborhood of Kingston. This increase may also be attributed to the disappearance of coarse fish, which used to feed on the ova of bass, pickerel, &c., &c. Several nets found in the reserved waters were taken up and destroyed.

Overseer P. Kiel, who has charge of the waters around Wolfe Island, issued fourteen licenses, mostly to farmers, who fish only when their labor is not required elsewhere. The home market is supplied from Georgian Bay. Salmon trout seemed plentiful, especially around Pigeon Island. No fishing was carried on at Charity Shoals, which is considered one of the best fishing grounds of Lake Ontario, nor at

Horse Shoe Island and at the head of Wolfe Island, owing to boisterous weather during the month of October. The close-season was well observed.

Overseers J. Cox, of Amherst Island, and N. Acton, of Gananoque, made no reports.

RIDEAU DIVISION.

COMPARATIVE Statement of the yield and value of the Fisheries in this Division.

Totals in lbs.....	146,500	115,200	94,000
Value..... \$	4,981 50	3,799 00	3,619 00

Overseer Geo. Jeacle reports that the catch of coarse fish during the spring months was poor, owing to the ice remaining so late. The fall catch was larger and of a better quality. Two fish-ways were built in the mill dams at Westport. The laws relative to sawdust and mill rubbish were well observed.

Overseer A. E. Mills reports that while the finer grades of fish in his division yielded about the same as in the previous years, the coarser kinds show a falling off, owing, undoubtedly, to the high state of the water on the spawning grounds. The Rideau is too small to allow of any gill net fishing being carried on; most of the fishing is therefore done by angling and trolling. This Overseer expected much trouble during the close-season, but the sending of a couple of Dominion policemen had the desired effect.

PRESCOTT AND CORNWALL DIVISIONS.

Value..... \$	12,192 00	33,056 00	32,500 00

Overseer Geo. B. McDermot, who has charge of Lake Scugog and tributary streams, reports a slight increase over the catch of last season. Five poachers were prosecuted for spearing. This will undoubtedly have a good effect on others. Shooting maskinonge in shallow water is a new kind of poaching which this officer has to contend with. It is urged that the enormous quantity of water used by the mills at Lindsay seriously interferes with the increase of fish in Lake Scugog.

LAKE SIMCOE DIVISION.

Overseers L. S. Saunders, of Barrie, and *Wm. Hastings*, of Roache's Point, report that since the lake was set apart, the fish have become more plentiful. No net licenses were issued, and it is a difficult thing to ascertain the catch with hook-and-line fishing. Mr. Saunders issued 549 angling permits and Mr. Hastings issued 908.

Overseer R. G. Dalton made no report.

Overseer Wm. McDermot, who has charge of the inland waters of the County of Simcoe, reports signs of improvement in the yield of fish. The quantity caught for home consumption was larger than the year before. Illegal fishing has been almost stopped. Several mill owners were fined for throwing sawdust into the streams. The close-seasons were much better observed than formerly.

MUSKOKA DIVISION.

COMPARATIVE Statement of the yield and value of the Fisheries in this Division.

Kinds of Fish.	1882.	1883.	1884.
Whitefish Lbs.	23,000	20,800	18,000
Trout "	4,600	3,537	3,500
Herring Brls.	90	83	90
Bass Lbs.	1,400	2,418	1,600
Pickrel "	1,600	12,470	5,200
Totals in lbs.	48,600	55,825	46,300
Value \$	4,458	3,255 24	2,578

Overseer W. E. Foot, who has charge of the inland waters of the Muskoka District, reports fish as plentiful as ever. No violation of the fishery laws came to his notice.

Overseer C. Roper, who has charge of Muskoka River and Mary Lake, states that fishing during the past year was satisfactory. The close-season was well observed. This officer apprehends that the attempts made to stock the lakes in his district with pickrel will not be a success, and he recommends to try it again on a larger scale.

No. 9.

MANITOBA.

WINNIPEG, MAN., 4th March, 1885.

Hon. A. W. McLEAN,
Minister of Marine and Fisheries.

SIR,—In your letter of the 28th November, 1884, in which you conveyed to me general instructions as to the duties of my office, you requested me to prepare, at as early a date as possible, a general report on the fisheries of this Province.

It may appear that some delay has taken place in my complying with your directions in this respect, but as the subject is a wide one, I have considered it best to make a thorough investigation before reporting to you.

I have therefore occupied my time in utilizing every available source of information and, as previously reported to you, have made one trip on Lake Winnipeg as far north as Beren's River. As a result of my inquiries, I have now the honor to report as follows :

1. As to the varieties of fish in the Province with the localities in which they are found.

Whitefish (*coregonus albus*) frequent the great lakes of the Province, seeks the shallows and spawns in the latter part of September and during October.

Lake sturgeon (*acipenser rubicundus*) frequents Lake Winnipeg—I am not personally aware of any other lake in which it is caught in the Province, though it is said to be obtained in Lake Winnipegosis, in which case it must also frequent Lake Manitoba.

Wall-eyed pike or (*doré*) pickerel. This most excellent fish, considered equal in quality to whitefish, frequents shoaler portions of the great lakes, and in August and September runs up the rivers to seek spawning grounds—spawns in the latter part of September and during October.

Moon-eye (*hyodon tergisus*). This excellent fish, very similar in shape and some distinctive marks to the black bass, is said to have been only seen in our waters during the past two years. In 1884 they were caught and marketed in considerable numbers and sold as black bass. They were chiefly taken in the Red River, south of its junction with the Assiniboine. A gentleman who has paid considerable attention to the matter gives it as his opinion that these fish have gradually found their way from the upper Red River, which some years ago was largely stocked with fish by the authorities of the State of Minnesota.

Lake trout (*salmo fontinalis*.) This fish has its habitat in the lakes east of Red River, in the Laurentian formation. It is at its best when taken where the water is at a low temperature. It seeks the shallows and spawns in October.

Catfish (*siluridae*). This fish is valuable for food when the waters are cold. It frequents the lakes and rivers through the Province.

Pike or jackfish (*esox lucius*) frequents nearly all the streams and lakes in the Province. Is a fair table fish, though somewhat rank; very destructive to other fish, especially to the whitefish and pickerel.

Gold-eye (*hyodon chrysopsis*). This fish is held by some to belong to the bass, and by others to the perch species. It is a favorite fish for the pan, and at some seasons, especially in the spring, is flaky and good. It comes into considerable consumption, and must be classed as important for food. The various other species of fish found in

the Province, such as the carps, suckers, &c., though marketed, can hardly be said to be important food fishes.

2. Varieties caught, at what seasons and by what means.

The first portion of this heading has been dealt with under the previous heading, that so far scarcely any attention has been paid to the restrictions as to seasons, and the fish have been caught as much during their spawning seasons as out of them, and by all possible means, regardless of the nature of the apparatus.

3. The amount caught for home consumption, with the average market price.

It is impossible at present to give any estimate of the quantity. The average retail prices in Winnipeg during 1884 were, for whitefish, 8 cents per pound; sturgeon, 10 cents per pound; pike, 3 cents per pound.

4. Quantity exported in 1883 and 1884:—

	1883.		1884.	
	Quantity.	Value.	Quantity.	Value.
Whitefish.....	72,867 lbs.	\$3,041	319,000 lbs.	\$14,036
Pike.....	51,850 "	1,041	561,833 "	13,855
Pickrel.....	2,400 "	480		
	127,117 "	\$4,582	920,833 "	\$27,894

RECOMMENDATIONS AND SUGGESTIONS.

Sturgeon.—At present there is no close season for this important fish. I would respectfully recommend that the months of May and June be established as the close season.

Whitefish.—The close season now is from 20th October to 1st November. This should be extended to from October 1st to 31st October, at the very least. On this point, I would refer to a letter addressed to the Hon. the Minister of Fisheries, by Indian Sub-Agent Quinn, of Indian Lake, Frog Lake, North-West Territory, under date of 28th November, 1884, and which was referred by you to me.

Pike.—It is not desirable that any close season be established, as the more of this piratical fish that are taken the better.

Export.—I would strongly urge that the exportation of all fish, other than pike and catfish, be prohibited, at least for a few years, for the following reasons:—If exportation is permitted to continue, and the figures I have given show the dimensions this trade has already attained, the fish in the Province will soon become as depleted in number as in the smaller lakes of the United States. The people of the central and north-western States have now to rely entirely, for their great consumption, on Lakes Superior and Michigan, within their own territory, and on any extraneous supply, such as that which is now being sent from this Province. Our supply, at amply remunerative prices, will be consumed by domestic requirements. A supply to foreign markets, from our by no means inexhaustible lakes, would, in a few years, so deplete them, that a great source of food supply for our present inhabitants and in-coming settlers would be practically destroyed. The importance of the fisheries, as a source for food supply for the Indian population, can hardly be anticipated. Already grave complaints have been made by many Indian agents in consequence of the threatened exhaustion of the fisheries, and I would especially refer you to the following letters on this subject, on file in your Department, viz.:—From the Deputy Superintendent-General of Indian Affairs, dated 13th November, 1884, and from Indian Agent Hourigan, of Rat Portage, dated December 9th, 1884.

INDIAN RESERVES.

Several agents of the Indian Department have urged on me the importance of fishing reserves for exclusive Indian use, being set apart. I am strongly convinced of the importance of this question, and would urge that their suggestions be acted on.

Inspector of Fisheries.

APPENDIX No. 10.

REPORT OF COMMANDER ANDREW R. GORDON ON THE FISHERIES OF HUDSON'S BAY.

TORONTO, 24th October, 1884.

To the Honorable

A. W. McLELAN,
Minister of Marine and Fisheries.

SIR,—I have the honor to report in reference to the fisheries of Hudson's Bay and Strait:

1. That the economic mammals and fish of those waters consist of whales, white whales (porpoise), walrus, narwhals, seals, salmon, trout, cod and a variety of small fish.

2. That the only fishing industries developed thus far, are the whale fishery by the Americans, and the porpoise, walrus, salmon and trout fisheries of the Hudson's Bay Company.

3. The chief whaling ground frequented, is the Row's Welcome, a vast basin in the northern portion of Hudson's Bay. Here the American whalers, chiefly from Massachusetts and Connecticut, have been conducting a very profitable fishery for more than a quarter of a century, and are still in active operation. I estimate that within the period mentioned, they have secured and exported from these waters, oil and bone to the value of over one million (\$1,000,000) dollars. This estimate is based upon ten whales a year for twenty-five years, counting each whale at four thousand (\$4,000) dollars, which is within the mark. The wintering quarters of these whalers is at Marble Island, on the north-western coast of Hudson's Bay. The whaling ships generally leave Massachusetts or Connecticut in July, and reach the island some time in September, and saw out of the ice in June of the following spring. They then press northward as far as the moving ice will permit, until the Welcome is reached, where they fish till the first of September, and then sail for home with their ships well loaded with blubber and bone. One or two whaling vessels winter at Marble Island every year; sometimes more. Although this industry is, as yet, comparatively small, I am persuaded, that from the large profits realised by those engaged in it, from the ample opportunities for its extension, and from the increased attention which is now being directed to the resources of the Hudson's Bay region, a much larger number of vessels will, undoubtedly, be drawn into it at an early day. I am satisfied that there are large numbers of whales in these waters, from the fact, that we met with them continually during the cruise of the "Neptune," and because, so far as I can learn, those engaged in the catch have never yet been compelled to return home without a fair cargo. The bark George and Mary (Capt. Fisher), of Connecticut, wintered at the island last season, sawed out of ice on the seventh of June of this year and succeeded in taking three whales in the open waters of the Bay before reaching the Welcome. Considering that five or six of the mammals would complete her cargo, it is easy to see that this fishery is by no means falling off.

4. Of the fisheries carried on by the Hudson's Bay Company, that of the white whale is most extensive. The blubber of these mammals weigh from 200 to 400 pounds each, and is very rich in the finest of oil. Each porpoise is worth about \$100. Last year the company secured nearly 200 in one tide, at Churchill, and a much larger number at Ungava Bay. They have established extensive refineries at several of their northern stations; and, instead of exporting the blubber in bulk, as formerly, they refine it, shipping the pure oil in casks. The porpoise are not shot or

harpooned, as is the case with the walrus and black whale, but are grounded on the flats, in coves, where the tide rises 15 or 20 feet, or more; and where, by means of trap-nets, they are held in check until the water recedes, leaving them high and dry on the rocks and sand. The process is very simple and inexpensive. The company also carries on a walrus fishery, sending two sloops annually from Churchill to two very productive walrus fishing grounds north of Marble Island, where they have never failed to secure as much blubber, ivory and hides as their vessels will carry. They took between 20 and 30 of these animals the present season, which were valued in the aggregate, to over \$7,000. I was furnished with an estimate of the value of the oil secured in, and exported from the Hudson's Bay region last year by the company and the American whalers, which, although I had no means of verifying, is probably much within the mark. It places the value of the export at \$150,000, or \$1,500,000, for the past ten years. I am satisfied that the walrus and porpoise fisheries may be developed to almost any extent; and, as increased attention is sure now to be attracted to this industry, we may rely upon its almost immediate extension. We met with walrus in great numbers at the western end of the strait. In one afternoon, while steaming from Cape Degges to Nottingham Island, we passed between 50 and 100 of them on the ice.

5. The company are also engaged at several points, particularly at Ungava, in the salmon and trout fisheries. These excellent fish abound in vast quantities in nearly all the streams, and are generally most plentiful at certain seasons, just above and near to the head of the tide where the salt and fresh waters mingle. From what I could learn of this industry, I concluded that it is but the beginning of what will, in the near future, become a very extensive and profitable business.

6. As yet cod have not been found in the waters of Hudson's Bay on the western portion of the strait, but they are very plentiful in all the coves and inlets on the eastern shore of Ungava Bay.

7. In conclusion, I have the honor to urge, that, in any negotiations concerning your Department with the United States Government, relative to a treaty of reciprocal trade, due allowance should be made for the great value of the fisheries of the Hudson's Bay region. If the Americans are to be permitted to continue in those waters, arrangements should be made by which Canada would receive substantial return for the privilege. I would further suggest that, unless a very large consideration is granted for the right, the Canadian Government should reserve the authority to license the ships and make and enforce such regulations, in regard to the methods of fishing, as will prevent the extermination of whales from our northern waters. I have only to call your attention, in support of this recommendation, to the fact that ten years ago there was a Canadian whaling fleet of over seven sail at Gaspé, annually reaping large returns. But when the Americans came into those waters with explosive bombs and other terrifying and destructive methods for securing whales, these animals were, in a very short time, completely driven out and this industry destroyed.

The Russian Government issues licenses for whalers in the White Sea and regulates the methods of fishing, fining heavily, or confiscating vessels found fishing without license or infringing the regulations in regard to the catch. And by parity of reasoning, I conclude that the Canadian Government possesses similar rights in Hudson's Bay.

I have the honor to be, Sir,

Your obedient servant,

ANDREW R. GORDON, *Lieut. R. N.*

Commanding Hudson Bay Expedition.

FISH BREEDING, 1884.

NEWCASTLE, 31st December, 1884.

The Honourable A. W. McLelan,
Minister of Marine and Fisheries, Ottawa.

SIR,—The following transactions and remarks relative to artificial fish-breeding in the Dominion of Canada, are herewith submitted.

The general success of the several institutions during 1884, as given below, will be found satisfactory as evidencing the onward progress of the work as a whole, although returns from some of the hatcheries do not show as large a crop of ova laid down, as in the previous year of 1883. The falling off in the quantity of eggs, being occasioned by a less number of parent salmon having been captured at some of the stations, than during the season of 1883.

There are now twelve establishments for the propagation of fish, by the artificial methods, in actual operation in the several Provinces of the Dominion.

These hatcheries are all, at the present time, largely filled with fish eggs, collected at various points throughout Canada, during the spawning season of 1884. The latest one, erected on the Fraser River in British Columbia, was only completed in time to receive its first crop of ova last autumn.

Particulars relative to the rearing and distribution of fry from eleven of the above mentioned nurseries, during the spring of 1884, are herewith submitted in detail; likewise, a descriptive account of the quantities and species of eggs that were laid down in each of the twelve hatcheries last autumn, is given below.

The total number of young fish of various kinds hatched, and turned out of these eleven institutions, into many of the rivers and other waters of Canada in 1884, amounted to 53,143,000; and the total quantity of eggs laid down in all the hatcheries in the fall of 1884, was 66,033,000.

The particular number and description of young fish bred in each of the nurseries in the several Provinces, during the hatching season or spring of 1884, was as follows:—

	Province.		
Sydney Hatchery,	Cape Breton.....	1,000,000	salmon
Bedford “	Nova Scotia.....	1,000,000	“
Dunk River “	Prince Edward Island..	1,000,000	“
St. John “	New Brunswick.....	811,000	“
Miramichi “	“	795,000	“
Restigouche “	Quebec.....	940,000	“
Gaspé “	“	859,000	“
Tadoussac “	“	985,000	“
Magog “	“	100,000	salmon trout
Newcastle “	Ontario.....	5,150,000	“
“ “	“	50,000	speckled trout
“ “	“	3,500,000	white fish
“ “	“	100,000	black bass
Sandwich “	“	27,000,000	white fish
“ “	“	10,000,000	pickerel

Grand total of fry of all kinds..... 53,143,000

These were divided by species as follows:—

Salmon, "salmo salar"	7,243,000
Salmon trout, "salmo lacustris"	5,250,000
Speckled trout, "salmo fontinalis"	50,000
White-fish, "coregonus albus"	30,500,000
Pickarel (doré), "lucioopercha"	10,000,000
Black bass, "gristes nigricaus"	100,000
Grand total.....	53,143,000

The particular number and description of fish eggs, laid down in each of the nurseries of the several Provinces during the spawning season, or fall of 1884, was as follows:—

	Province.	
Fraser River Hatchery,	British Columbia.....	3,000,000 salmon
Sydney	Cape Breton.....	931,000 "
Bedford	Nova Scotia.....	800,000 "
Dunk River	Prince Edward Island.	1,250,000 "
Miramichi	New Brunswick.....	1,000,000 "
St. John River	"	186,000 "
Restigouche	Quebec.....	700,000 "
Gaspé	"	341,000 "
Tadoussac	"	775,000 "
Magog	"	No return, salmon trout
Newcastle	Ontario.....	4,000,000 "
Newcastle Hatchery	"	3,000,000 speckled trout
do	"	3,000,000 white fish
Sandwich	"	50,000,000 "

Grand total of eggs of all kinds.....66,033,000

These were divided by species as follows:—

Salmon, "salmo quinnat"	3,000,000
Salmon, "salmo salar"	5,983,000
Salmon trout, "salmo lacustris"	4,000,000
Speckled trout, "salmo fontinalis"	50,000,000
White-fish, "coregonus albus"	53,000,000

Grand total.....66,033,000

Details of the operations at each of the hatcheries during the year, will be found in the report of the several officers in charge, in the appendix attached hereto.

TRANSACTIONS AND REMARKS.

A short descriptive account of the several fish hatcheries is here given from a personal inspection made of several of them last summer; and from a general knowledge previously obtained of the others, and also from information gathered from the correspondence and reports of the officers in charge. Remarks are also offered with the view to further develop the working capacity of these institutions, and specially to dispel, if possible, wrong impressions formed regarding the working of them; and also to offer some practical information as to the nature and some of the habits of salmon, at the time of entering the rivers, for spawning purposes.

PROVINCE OF BRITISH COLUMBIA.

I.—FRASER RIVER HATCHERY.

This salmon breeding establishment is situated on the Lower Fraser, at a point some four miles above New Westminster, on the opposite shore. The building was commenced in 1883, and completed during the present year. It is perhaps the most extensive salmon hatchery yet built in Canada. Its location was made, and the final completion of the whole establishment was carried out by Mr. Thomas Mowat, during my connection, and attendance in England with, the work of the Canadian branch of "The Great International Fisheries Exhibition, London, 1883."

Not having had an opportunity of inspecting this institution, I can as yet only speak of its adaptability for the practical work of fish breeding, through the medium of the report of Mr. Mowat, the officer in charge, which gives a satisfactory statement of the operations, and judging also from the quantity of eggs laid down in the hatching trays this season, the institution has made a very creditable commencement. In future years, no, doubt, the numbers of ova will be largely increased, especially when it is known that salmon are obtainable to an unlimited extent in the Fraser River and its tributaries.

It appears that a much less period of time is taken to hatch the "Quinnat" salmon in the waters of the Fraser, than the "Salar" of the rivers of the Maritime Provinces bordering on the Atlantic coast. In the former only about two months are taken to bring out the fry, whilst in the Atlantic rivers five, and six months, elapse before the embryo breaks the shell. This is readily accounted for by the temperature of the water, as it is the medium by which the hatching of the eggs is hastened or retarded. The average temperature of the water in the Restigouche River in New Brunswick, during the two weeks ending the 22nd of November last, was recorded at 35 degrees; and in the Fraser River in British Columbia, for the same period, it was 45 degrees. In a comparison later on, it would be found that, the temperature of the water in the Fraser River would be relatively much higher than in the Restigouche.

Upwards of three millions of ova were obtained for this hatchery. About a quarter of a million of these were taken from the so-called "Suckeye," and the balance from the "Quinnat" salmon. The last named species is considered superior to all others of the salmon family in Pacific waters, for canning and commercial purposes. They do not, however, appear to be as prolific as their congeners in the Atlantic waters. The returns giving only an average of *four thousand eggs* to the Fraser salmon, whilst the average quantity of ova obtained from the Atlantic salmon, at eight hatcheries is reported as about *seven thousand each*. A fair standard of about six hundred and fifty eggs, to every pound of the flesh of the Atlantic salmon, having been pretty well established, leads to the conclusion that, the "Quinnat" salmon of British Columbia are either less in size, or less prolific than the "Salar" of the Atlantic coast.

But the statement given by Mr. Mowat and by others, goes to show that the "Quinnat" are larger than the "Salar." If this be the case (to me doubtful) then the reproductive powers of the Fraser River fish are less by some 50 per cent., than those of the Atlantic rivers. In carrying this line of reasoning further, it will go to prove beyond a doubt, the paramount necessity for enforcing judicious and stringent laws, for the better preservation of these valuable fish in British Columbia; else, the

**Note.*—At the United States salmon breeding station on the McLeod River, California, during the season of 1881, seventeen hundred and twenty-nine (1,729) salmon gave seven million two hundred and seventy thousand (7,270,000) eggs, or an average of four thousand two hundred and five (4,205) eggs to each fish, and the average weight of these fish was eleven and three quarter ($11\frac{3}{4}$) pounds. This gave only three hundred and fifty-eight (358) eggs to every pound of flesh. Whereas an average of between six hundred and seven hundred ova is found in the Atlantic salmon, with a general run of about twelve pounds weight to each.

same disastrous results which have befallen most of the rivers in the Eastern Provinces, will be brought about more quickly. Therefore, it is that, the British Columbians, no doubt, have shown their wisdom in demanding this extensive salmon hatchery for their Province, at this early date, in order to supplement the supplies of these fish which are now being so avariciously destroyed by those who are engaged in their traffic.

Mr. Mowat's report will be found in the appendix, which gives details of the construction of the hatchery, and particulars in relation to capturing parent fish, etc.

Total number of eggs collected for this nursery, in the fall of 1884, 3,000,000.

PROVINCE OF NOVA SCOTIA.

II.—SYDNEY HATCHERY, CAPE BRETON.

This salmon breeding establishment, erected in 1881, is in good working condition. No expenditure was incurred at this hatchery during the past season, other than to strengthen the dam from which the supply of water is obtained.

The salmon for this institution are, of necessity, procured during the spawning season, from several rivers in Cape Breton. Some of these are near by, others are at considerable distances from the hatchery. The Margaree River, the principal one in which parent fish are captured, is the most distant. On this account, a pond, or reservoir was constructed there, for retaining the parent fish till thoroughly matured. In addition to the Margaree, salmon were secured in the Middle, Sydney, and Salmon rivers; also in Balls Creek.

Three hundred and twenty (320) parent fish were caught to stock the hatchery with eggs; of these one hundred and forty-five (145) were females, and one hundred and seventy-five (175) males. From which was collected nine hundred and thirty-one thousand (931,000 eggs.) These were laid down in the hatchery trays, and from the latest accounts they are progressing most favourably. The average number of ova collected from each female fish, was five thousand three hundred and fifty (5,350); this would indicate the average weight of each fish, at about nine pounds.

One million and fifty thousand (1,050,000) eggs were laid down in the Sydney Hatchery in the fall of 1883. From these eight hundred and fifty-three thousand (853,000) fry were hatched in 1884, and planted in the following rivers and smaller streams, namely: Sydney, Salmon, Morgan and Middle Rivers; Balls Creek, and in Trout, Black, Clerks, Big, and Hatchery Brooks.

Total number of fry hatched out spring of 1884	853,000
--	---------

Total number of eggs laid down in the fall of 1884	931,000
--	---------

PROVINCE OF NOVA SCOTIA.

III.—BEDFORD HATCHERY.

I visited this salmon-breeding establishment in August last, and upon inspection found that parts of the building were very much decayed, more especially the lower floor, sills and hatching troughs, all of which must necessarily be repaired during next summer. The hatchery has been in operation several years, and it is only reasonable to conclude that, where exposure of those parts to dampness is continuous, the woody substance will soon decay.

Instructions were given to make such repairs only as would carry the work of the establishment over the then coming busy season and winter, with the view to making permanent improvements during the slack season of 1885.

Upon consultation with the officer in charge, in relation to the required repairs, it became conclusive to my mind, both as regards economy and durability, that, (1)

A floor for the hatching room made of broken stones (of which plenty were immediately alongside the building) and covered with cement, should replace the present wooden one; (2) A complete new set of hatching troughs was required; (3) The half-constructed reservoir for parent fish should be completed; (4) Increased accommodation for the officer in charge was required. These and other minor matters are essential to the proper working of the Bedford Hatchery, and should be entered upon for early completion next summer.

The work of gathering eggs for this hatchery this autumn has not been so satisfactory as in former years. Two causes are given for this want of success: First, the extreme high water in the early part of the season caused the fish to run far up the stream, beyond the limits of usual operations for capturing them. Secondly, although salmon were said to be plentiful in August and September, in the harbors and estuaries, yet from the continuous drought which followed the earlier rain-fall, the rivers and streams became so very low in October and November (the usual time for capturing fish) that salmon were prevented from ascending the rivers to the points where the spawning tanks were located. Large numbers of eggs were said to have been laid in the tidal waters, where, as a matter of course, they would perish.

Only the small number of ninety-two (92) breeding salmon were obtained for the uses of the Bedford station, seventy-five were females. These gave a total of eight hundred thousand (800,000) eggs, with an average of ten thousand six hundred (10,600) to each female.

Notwithstanding the decrease in the numbers of salmon captured for the uses of this hatchery, it is gratifying to learn from many sources, that the quantities of these fish that entered the rivers of the central parts of the Province were largely in advance of former years, resulting, in a great measure, from the liberal supplies of fry which were planted in them, and bred by artificial means at the Bedford Hatchery. The strongest evidence of this is shown in the Lahave River, where great wonderment was expressed by the inhabitants, at the return of salmon with increased numbers, for the past three years, many of them having been caught below the mill-dams at Bridgewater, where these fish had been almost unknown for many years, or since these dams were built across the river. The fact, however, of some two hundred under-sized salmon, having been caught in 1883, and upwards of five hundred in 1884, and the mill-dams being in the same state as formerly, created considerable surprise, and many surmises were made as to where these salmon originally came from.

Upon investigation, it was found that Mr. A. B. Wilmot, officer in charge of the Bedford Hatchery, had planted some 20,000 salmon fry in the headwaters of the Lahave River, in 1878; and in each year since from 2,000 to 20,000 more have been added. These fry were taken from the hatchery and transported by the Annapolis and Windsor Railway, to a point where it would be most convenient to convey them by waggon to the nearest brooks or feeders of the Lahave River; this was about ten miles. Here the young fry were planted in the full belief that those which would survive the dangers and difficulties that might befall them on their migration down some fifty miles of the Lahave, to the sea, would, when arrived at sufficient maturity to reproduce their species, return again to the same rivers, to carry out this great law of nature. This return to the river from whence they migrated would, by instinctive teaching, be performed with unerring certainty; unless prevented by insurmountable barriers and other obstacles found in their way, such as mill-dams, nets, rivers and such like. It has been held by the inhabitants on this river that salmon had not for many years been known in the Lahave. The mill dams prevented these fish from ascending the river. The female salmon become sufficiently matured to reproduce their species in a period ranging from four to seven years; depending largely upon the supply of food obtainable in their earlier growth in the streams as "Parrs" and "Smolts"; (young salmon before they go to salt water) and, during their sojourn in the sea, arriving at their first state of maturity; the males, as a rule, reaching the same stage a year sooner than the females. It is only in order to reproduce their kind that salmon enter rivers, or fresh waters, at all;

they do not feed in fresh waters, nor in rivers. The salmon taken in the Lahave, in 1883 and 1884, were said to be rather small in size, not up to the standard of the fish in bygone years. Summing up these facts, viz., the absence of salmon in the Lahave for many years, their somewhat numerous return again in 1883 and 1884, their low average as to size, the several mill-dams across the river, forming almost impassable barriers for parent salmon to surmount, consequently forbidding the possibility of eggs being deposited on the natural spawning grounds far up river, then, the fact of several thousands of young artificially bred salmon being put in the upper waters of the Lahave, four and five years previous, all these things cannot but lead to the almost certain conclusion that the usual numbers of salmon caught in the Lahave River, in 1883 and 1884, were the product of the fry put in that river from the Bedford Hatchery in 1878 and following years.

The Liverpool and Port Medway Rivers, on the same coast of Nova Scotia as the Lahave, have also had moderate supplies of young salmon, from the Bedford establishment, put in them; and these rivers are also showing satisfactory signs of improvement. There are no obstacles in the way, such as mill-dams, on the Port Medway River, to prevent salmon from ascending the stream for a considerable distance; and here a most decided increase in the catch of salmon, by netters and anglers, is reported over former years. The direct evidence for a share of this improvement of the Port Medway, cannot be so clearly shown as in the Lahave; in the former, there are no obstacles in the way for parent fish to ascend and deposit their ova on the spawning beds; whilst in the latter this natural method of reproduction is overcome by the obstruction in the way to prevent it. Now, when the fruits of the planting of artificially bred salmon fry in the Lahave are so apparent, why should not the same result be had from the depositing of fry in like manner in the Medway, Liverpool and many other rivers in the country?

One million (1,000,000) of young salmon were hatched out in the Bedford Hatchery last spring from eggs laid down the previous fall. These fry were widely distributed in the rivers of Nova Scotia, and the following named counties were the recipients of them, viz.: Halifax, Hants, King's, Cumberland, Colchester, Pictou, Annapolis, Lunenburg and Yarmouth.

The report of the officer in charge of the Bedford Hatchery will be found in the appendix. It contains matter of much interest in relation to the preservation and improvement of the fisheries of Nova Scotia.

Total of fry hatched out in the spring of 1884.....	1,000,000
Total of eggs laid down in the fall of 1884.....	800,000

PROVINCE OF PRINCE EDWARD ISLAND.

IV.—DUNK RIVER HATCHERY.

Returns show this hatchery with its appliances, to be in very good repair at the present time. From the effects of an unusually heavy freshet last spring, portions of the reception house for entrapping the fish, were partially injured. This and other small repairs were completed in time for the run of fish, which commenced in October and continued till the 30th of November, when two hundred and twenty (220) salmon were engaged in the pens.

Of these 220 fish, one hundred and sixty (160) were females; the balance were males. From the females, one million two hundred and fifty thousand (1,250,000) eggs were taken, with an average of 7,800 to each female, thus giving to them a standard of 13 lbs. in weight, by the usual calculation of eggs to the pound of flesh.

The officer in charge reports that quite as many eggs were deposited in the natural way, by a large number of salmon in the river below the hatchery, that did not attempt to reach the site of the reception house. Unusual numbers of small-sized fish, and grilse, entered the river during the spawning season.

Smolts, or immature salmon, are mentioned as being very plentiful in the Dunk River, and Wilmot River, near by. The same is said of all the rivers where fry have been planted. Several salmon were taken with the hook and line, near tide water. These accounts give satisfactory indications with regard to the benefits from protection and propagation in the Dunk River.

One million (1,000,000) young salmon were turned out of this hatchery into many of the rivers and streams in the Island, during the past spring; these were the product of the eggs laid down in the fall of 1883. The transport of these young fish, by railway and other means of conveyance, to the several places selected for them, was safely performed. Large supplies were deposited in each of the following rivers:—Dunk, Wilmot, West, Morrell, Brudenell, Montague, Wheatley, Trout No. 10, Trout Newbarton, Hunter; and also several smaller streams.

Total of fry hatched out in the spring of 1884..... .. 1,000,000.

Total of eggs laid down in the fall of 1884,..... .. 1,250,000.

PROVINCE OF NEW BRUNSWICK.

V.—ST. JOHN RIVER HATCHERY.

Having made an inspection of this establishment during the past summer, I found everything connected with it in the most perfect order. Its capacity and convenience for the general work of hatching fry and distribution of young fish from it, is unequalled at any of the other locations where institutions of a similar kind have been built in the Maritime Provinces.

The supply of water for breeding purposes is brought by an underground pipe some distance from the main building. Here it was thought advisable to make some improvement in order to prevent the possibility of the action of the frost stopping the full flow of water during the winter. The officer in charge has had this work done, thus making the direct working means of the hatchery most complete.

Whilst this establishment in itself is thus so admirably adapted for its work, the system adopted for procuring parent salmon to supply the hatchery with an adequate number of eggs, is becoming, year by year, less effective. The wholesale destruction of salmon by every possible means, legal and otherwise, in the upper parts of the St. John River and its tributary streams, has so reduced the supplies of breeding fish formerly found in those parts of the river, that it may now be said to be almost an impossibility to obtain even a tithe of the mother fish necessary to stock the nursery with eggs.

In addition to this deplorable want regarding the number of parent fish required for the natural and artificial reproduction of their species, from a pecuniary point also it is really unwise to continue the disheartening trials hitherto practised for capturing parent salmon, even in the Tobique River, which is really the best nursery stream of all the branches of the great St. John River.

Even with the personal efforts of the officer in charge of the hatchery, a thoroughly practical and painstaking man, and extremely zealous to obtain success, and a crew of men, they were, comparatively speaking, unsuccessful in their endeavors to capture a sufficient stock of parent salmon up the Tobique River, and the cost of the few that were caught, if it had been used in the purchase of fish at the harbor fisheries, or even elsewhere, would have secured fully four times the number; thus giving to St. John River Hatchery upwards of half a million (500,000) of eggs, instead of the insignificant quantity now deposited in it. Special reference is drawn to the statement made in the report of the officer in charge of the St. John River Hatchery, which will be found in the appendix, when he refers to the want of necessary protection, and the devising of some other method than the present one, by which a supply of ova may be had for the hatchery under his charge.

As my views on the subject of stocking this hatchery have been so frequently expressed, I will now, only quote one extract from my annual report to your Depart-

ment, published in 1881. The experience had since, convinces me more thoroughly of the necessity of a change, and of the easy accomplishment of that plan, and also the futility of the method now adopted.

"Efforts have thus far proved futile (and it will be useless to continue them) for procuring supplies of salmon ova in the upper parts, or branches of the St. John River. If this fish hatchery is to be carried on, it will be absolutely necessary to obtain the ova for it from the estuary and tidal fishing stations, or else import the eggs from distant points. This latter plan appears very objectionable, in the face of the fact of the easy means which are open for procuring an adequate number of salmon from the trap-nets which are set in the St. John harbor. From information received from reliable sources, salmon, in sufficient numbers to give two or three millions of eggs could be purchased annually from the tidal fishermen.

With all the efforts put forth last autumn, only forty-three (43) salmon were captured by Mr. McCluskey and his men, twenty-five (25) were females and eighteen (18) males. The former gave one hundred and eighty-six thousand eggs, or an average of about seven thousand four hundred each.

These eggs were obtained at very great expense, on account of the more than ordinary difficulties connected with the catching of them, and carriage from the Serpentine River down the Tobique, to the Hatchery. Notwithstanding these difficulties, they are reported as presenting a very satisfactory appearance in the hatchery troughs of the nursery.

There were eight hundred and ninety four thousand (894,000) salmon eggs laid in the troughs of this institution in the fall of 1883. 284,000 of these were collected in the Tobique River; 210,000 were got from the Tadoussac nursery in the Province of Quebec; and 400,000 from the Restigouche Hatchery. The latter number were by far the best. Less of these died during the period of incubation, and they produced larger and more vigorous fry. On account of the Restigouche eggs being obtained in March few losses were sustained, consequently the high average of nearly 90 per cent. of fry from all the eggs in the St. John River Hatchery is accounted for, the gross product being 811,500. These were deposited in the following named waters: The St. John, Tobique, and Salmon Rivers, in Victoria County; Skiff Lake, in York County; Baker's and Emmerson Brooks, Madawaska County; and a large number were put in the Rapid des-Femme stream, which feeds the hatchery.

There will be found in the report of the officer in charge of this hatchery, in the appendix, the following paragraph:—

"I desire to refer to a novel occurrence that took place on the Tobique River. It is a well understood fact that, rarely, if ever has it been known that, a salmon would rise to an artificial fly on the Tobique River, but last summer an American gentleman from Boston, killed eighteen salmon with the fly, on the right hand branch. The question now presents itself; has artificial fish culture, by the introduction of fry from other rivers caused this change? I am inclined to think it has."

This circumstance is a peculiar one, especially when hitherto it has always been held that the St. John and Tobique Rivers were not salmon angling streams. It may therefore be, and the statement fairly gives rise to the possibility that, the introduction of a family of salmon, natives of a famous salmon angling river like the Restigouche, into the waters of the above mentioned river for several years past, has brought about this interesting result; and it would also go to show that, if the operations connected with the artificial culture of salmon in the country, capable (to say the least for them) of causing attraction for the angler. How much more must the benefits from the industry be felt by the country at large from a commercial stand point.

Other remarks contained in the report of this officer with regard to the protection of salmon in the St. John and Tobique Rivers, claim the attention of your Department.

Total of fry hatched in the spring of 1884.....	811,000
Total of eggs laid down in fall of 1884.....	186,000

VI.—MIRAMICHI HATCHERY, N.B.

This hatchery, among the foremost built, required a good deal of renewing. I thoroughly inspected the whole establishment last summer, and found it necessary to order many repairs; a new foundation throughout, new floor, new hatchery troughs, and other matters of less magnitude required immediate attention to put the establishment in proper working condition for the then coming season's work. These repairs have since been fully completed; as the foundations are now made of cedar, a long time will pass before any further expense will be necessary on these parts of the building at Miramichi.

The system pursued here of capturing parent salmon up river late in the autumn, should be discontinued, and the method adopted and found thoroughly satisfactory at Tadoussac and Gaspé should be applied. There is an extensive pond here of large surface area, with a depth of several feet of water, fed by a constant flowing stream, which should be well adapted for retaining quite a number of salmon. This pond is capable of being easily arranged by the placing of a weir across its outlet, to admit of the influx of the river water at high tides. This, in addition to the constant run from the small stream, would materially assist in the further aeration and purification of the pond. No serious difficulty has been experienced in conveying salmon alive to this reservoir, as scows can be floated into the very pond itself at high tides.

There are several very good fishing stations within the distance of a couple of miles of the hatchery leased by your Department to fishermen, who, no doubt, would enter into some satisfactory arrangement by which the salmon caught by them could be kept alive, and then transported in scows to this pond alongside the hatchery.

At present the salmon which are caught late in the fall up river, some twelve and fifteen miles, are carried in cribs or scows down river to the hatchery, therefore it must appear more reasonable that, the stock of parent salmon should be caught at the shorter distance of two or three miles, and floated to the pond in the same manner as has been the case for several years past. An objection is brought against the catching of salmon in the earlier season, when netting is legally permitted, that greater losses would be experienced by keeping the fish through the warmer months in the fresh water pond. This anticipated danger need not prevail to any great extent, particularly if the necessary care were taken to avoid injury to the fish, at the time of their capture, and carriage to the pond; and even should some slight mortality take place from the above method, it would be more than compensated by the certainty of obtaining the necessary stock of parent salmon, and by permitting the fish, which would otherwise be caught by the usual way, to pass up river unmolested (by the operations of the hatchery at least) and deposit their eggs on the spawning beds in the natural way. And for another cause it might be held as more beneficial to obtain the earlier run fish, for an idea now prevails (whether fallacious or otherwise) with some experienced fishdealers that the breeding of young salmon from the very late runs of mother fish, has a tendency (upon the principle that like begets like) to increase the numbers of salmon which enter the rivers after the close season has set in; and not to benefit the catch of early running salmon, which are the fish usually taken for commercial purposes.

Yet again, the most potent reason that may be given, in favor of procuring the early runs of salmon for artificial breeding purposes is that, the fish being captured alive, and so kept until manipulated, and then set at liberty again, leads to the satisfactory conclusion that many of them do return in following years; whereas if not so utilised these same fish would be put in the market for consumption, thus causing their total destruction for reproductive purposes, and resulting in the loss of tens of thousands of ova which would be contained in their bodies. But by the other method these eggs, by being artificially hatched in the breeding houses, would yield a large percentage of your salmon to stock, and otherwise enrich many of the river and tidal fisheries of the country.

From information from the officer in charge of the hatchery, and from many other sources, the catch of salmon in the Miramichi, more especially in the lower parts of the river, is very much on the increase. The fly fishermen give astonishing accounts of the numbers of grilse to be seen in the upper parts of the many branches of this river. During the time of netting parent salmon for this hatchery, last fall, a hundred of these grilse would be swept out of one pool. This marked show of young salmon in the Miramichi and its tributary streams gives the strongest indications of the river being well supplied with young fish, to say the least of it, and this increase must have been brought about from some beneficial cause. Why should not some credit for this be given to the planting of large quantities of salmon fry in the several branches of this river annually, that were bred in the hatchery. But the people say, yes, there is certainly an increase of grilse, and other undersized salmon, but where is the increase in the large or marketable salmon which ought to be in the river? The question is easily answered: If the large or mature salmon are caught so numerous by the trap nets and other engines of destruction, as they really are in the estuary and coast fisheries, it cannot be expected that the usual numbers (or even a moderate supply) of the full grown fish can reach the river. But the grilse and smaller sized salmon do, for they get through the meshes of the nets which are set along the coast. Now, if some limitations or severe restrictions are not put upon these coast nets, which are yearly on the increase, not only will the salmon become less numerous in the rivers, but the general catch along the coast must fail also. Accessions to the demands for using these most destructive engines will soon bring about a serious impoverishment to the whole of the salmon fisheries connected with the Miramichi River, its estuaries and coasts adjacent thereto. The prevailing greed shown by the fishermen, to overdo a fair and legitimate catch of salmon, proportionate to the producing powers of rivers, must sooner or later impel Parliament to enact a law similar to that enforced in England from like causes, namely, "The abolition of the use of all fixed engines for the capture of salmon." It will be found to be utterly useless to protect the salmon rivers of the country, or to propagate fry for them, unless a corresponding amount of wisdom is shown by the Legislature to prevent the inordinate and avaricious desires of the people from destroying these fish to such an extent as to over-ride their powers of reproduction, and ultimately bring about their extermination.

The officer in charge of the Miramichi Hatchery reports the capture of 273 breeding fish. These were netted some distance up the river above tideway. One hundred and thirteen of these were males, and the balance, or 161, were females, which gave 1,000,000 of eggs, upon an average of 6,250 to each spawner. Taking the previously given standard of eggs to the pound, these fish would show a general average in weight of about $10\frac{1}{4}$ pounds. The eggs are reported as progressing favourably at the present time.

The supply of ova secured for this nursery in 1883 was set down at £50,000. An evident error must have crept in here, as the officer's return now shows a successful distribution of 795,000 fry, as being the product of the hatching in the spring of 1884. These young salmon were conveyed safely to the following waters, namely, the North-West, Big South-West and Little South-West Branches of the Miramichi, the Sevogle and Renons Rivers and Stewart's Brook.

Total of fry hatched spring of 1884.....	795,000
Total of eggs laid down fall of 1884.....	1,000,000.

PROVINCE OF QUEBEC.

VII.—RESTIGOUCHE HATCHERY.

This salmon-breeding establishment is located upon one of the finest salmon rivers in the Maritime Provinces. The actual number of fish caught in the fluvial, tidal, and coastal waters, connected with the Restigouche River are not surpassed by

any other, and the commercial benefits to be had from this natural source of wealth, are of the greatest importance, not only to those directly engaged in the local traffic, but also to the country at large.

Upon an inspection of the Restigouche Hatchery, made last summer, it was found that the old building put up many years ago had outlived its period for usefulness, on account of its generally dilapidated state, and the almost total decay of certain portions of the structure, with the tendency of its sides to fall in by the action of frost, as the walls were built against an excavation made in the banks of a small stream. By referring to the Fisheries Report of 1881, it will be found that attention was then drawn to the unsafe and dilapidated condition of this hatchery, and in the same report reference is made to the erection of a very extensive building and dams further up river, to supply the place of the old works. This new establishment when almost completed, was, by orders of your then Commissioner of Fisheries during the summer of 1883, pulled to the ground, and carried in pieces down river some twenty odd miles to "Dee side," the site of the present hatchery. In accordance with Departmental instructions, another site was chosen in August last, upon which to rebuild the several parts of the taken down edifice found suitable for use. The new site consists of about two acres, beautifully situated and very well adapted for a fish breeding establishment. This location increases the area of the property upon which the present old hatchery stands, and takes in the brook for water supply, and also gives free ingress and egress to the main road, and to and from the Restigouche River. This fish-breeding establishment has been put up under the immediate supervision of Mr. Alex. Mowat, who acted upon instructions given to him by me from time to time. It is sufficiently advanced to receive the troughs and other apparatus which will be in readiness to put in place next spring, when the whole establishment will be fully completed for the reception of the forthcoming crop of salmon eggs for the season of 1885. The hatching capacity of this institution will be sufficiently large to accommodate some 6,000,000 and upwards of salmon eggs, and will be considerably in advance as to size and general outfit for all practical purposes for breeding the Atlantic salmon, of any similar institution on this continent, or even in the Old World. When arranging for the work of this hatchery, I also made an inspection of the inclosure or pond used for impounding the parent salmon for supplying this nursery with eggs. This pond is situated at the extreme head of tide water, and is closed in by crib work put across the two ends of a narrow channel, which runs between two islands, in the centre of the Restigouche River. The inclosure is sufficiently spacious to retain a very large number of salmon; with a depth varying from three to twelve feet, and with a fresh current from the main river always passing through, so that a large supply of healthy aerated water is provided for the salmon to roam about in during the summer, and until they are ripe for spawning. The great advantage connected with this large pond or reservoir is its closeness to some of the best fishing stations; where, with proper arrangements being made with the lessees of these grounds, a sufficient stock of breeding fish may be secured, almost with a certainty, from the early "runs" of salmon passing up the river. The present inclosure is capable of being extended to any desired length without any difficulty; as a purchase was made by your Department, which secures the privilege of this channel with a strip of land on the banks of both islands forming the passage. Scows or fishing boats can run up to or even into the pond from the main river at convenience, by which means unusual facilities are given to convey the fish alive, with very small chances of injury, from the stations near by directly to this reception pond.

Another source of convenience, which certainly warrants a more speedy means of recuperation from the exhaustive effects of spawning is secured by the selection of this pond just at the head of tide water. For, after the process of manipulation by the artificial method is performed, the fish are at once put in the open river, and are immediately carried down by the first falling tide to sea, where, from the healthful effects of the salt water, their desire for food returns to them again, and they soon recover from the emaciated state they had contracted from their lengthened sojourn in the fresh water, where, by a peculiarity of the nature of salmon, they do not

take food. Not so, can they so quickly, or surely reach their healthful and natural feeding grounds in the sea when captured on their spawning beds far up river, from which points weeks and months will elapse sometimes before they are enabled to reach salt water. From this latter cause, combined with the daily increasing prostration following the effects of spawning, and long abstinence from food, some fish necessarily die.

This mortality among salmon after spawning in the natural way, shows itself in all rivers and streams, in all parts of the world, in a greater or less degree, according to circumstances. But in rivers where these fish are very abundant, as in the Fraser, Columbia, Sacramento and others on the Pacific coast, it prevails to such an alarming extent, as to give the belief to many of the inhabitants, and, even to some writers, who are considered to be authorities on the subject that, all the salmon there, after passing through the ordeal of spawning die. The only evidence alleged is that, thousands upon thousands of salmon are found floating down these rivers in a dead and dying state. This great death-rate in rivers, where; it is said, salmon are so numerous as to actually crowd themselves from the streams upon dry land, may be somewhat reasonably accounted for, as previously mentioned, namely: From extreme emaciation; from their long and wearied migration up river; from their non-eating propensity in fresh water;* and from the physical change brought about by

* NOTE BY MR. WILMOT.—Salmon do not take food on their migration up rivers to their spawning grounds. This view is now almost universally held by all persons practically acquainted with the nature and habits of the salmon. There are, however, some disbelievers of this statement. The following facts are given to sustain Mr. Wilmot's position, viz :—

(1) The stomach of the salmon is found distended with food in a half-digested state, when captured beyond the estuaries of rivers and in the sea.

(2) Food is never found in the stomach of the salmon above tide water or in the fluvial parts of rivers.

(3) Salmon begin to deteriorate in flesh and in colour, as soon as they enter the fresh water, and continue this falling off until they reach salt water and commence feeding again.

(4) After being in the rivers for a time, from the fat, silvery-coated salmon, they change to a lean, lank, emaciated, dirty, black-looking fish; in many instances after spawning they become so poor and prostrate that great numbers die.

(5) The fatty substance of the body put on in their feeding grounds in the sea, is consumed by internal absorption, to partially sustain the fish on his migration up rivers, and to nourish the growth of the ovaries and milt for maturity, previous to being laid in the spawning beds. The fatty substances of the body thus passing into the ovaries, presents to the eye the small, oily globules seen in the eggs when laid, and forms the food of the embryo fish before, and for a short time after, hatching out.

(6) The writer has seen many salmon opened, and has opened many hundred himself when caught in fresh water, but in no instance was there ever one particle of food found in their stomachs. He has also kept confined in ponds, numbers of salmon before and after spawning for periods of two, eight, and twelve months, where natural food was plentiful, yet they never took it, but could, nevertheless, be caught with an artificial fly.

(7) In all cases when opened, the gullet, or entrance to the stomach, seemed, as it were, from its closely contracted appearance, to forbid the possibility of food of any kind passing through it.

(8) The great numbers of salmon that enter many of our rivers would, if they took food to sustain their large bodies, consume at one single meal every living creature in the river that would be adapted for them to eat—yet in many instances, and in many rivers, salmon are from one to five and six months in the fresh water, on their journeys to their spawning grounds.

(9) In the Fraser and other rivers on the Pacific slope salmon are so abundant in them as to actually crowd themselves upon the banks. Query—Where and how could it be possible for these vast shoals of salmon to procure sufficient food to sustain them in the narrow confines of the river? On the contrary they become lean, exhausted, and after spawning die in thousands from sheer emaciation.

(10) It is well known by anglers that when salmon are taken with the fly, the hook is seldom found deep in the mouth, and never in the gullet, but almost invariably the fish is hooked on the inner or outer sides of the jaw, and now and then in the tongue. If taken voraciously for food, why not find the hook in the gullet, as in trout and other fish that actually take it for food by swallowing the bait?

(11) It may be asked, then, why do salmon rise to the fly at all if not for food? It is the exception, not the rule, to take salmon with the fly; they take it sometimes in anger when crossing their vision; and, sometimes from a sportive mood, in seeing a luring, dangling object above them. Dozens, yes, hundreds of salmon are often seen in pools by the angler, who may cast over them for days without taking a fish, and then, perchance, some morning or evening he may hook one, two, and sometimes more. Now, if these took the fly for food, why not capture many more of the hundreds that certainly ought to be in the same eating mood as their fellows who were taken?

(12) The sequel is here: By a wise ordination of Providence salmon are not permitted, by an instinctive feeling in their nature, to feed upon their own offspring, and in the very same nurseries, too, in which they had at a former period laid their eggs to reproduce their species. Did the salmon feed in the rivers and other streams which are their breeding grounds, in like manner as in the sea, which is their feeding ground, the beautiful aim of nature to safely maintain their species would be

the emission of the ova and milt from their bodies, culminating, at last, in a great many instances, in utter prostration, and finally death. But, to hold that the great law of nature with all creatures, "to multiply and replenish their kind," shall be so subverted in the case of the salmon as to cause all those frequenting the Pacific rivers to die at the time, or immediately after the period of spawning, cannot be admitted, nor is it so. Whilst statements are often made that thousands of sickly, dying and dead salmon are *seen* floating down these rivers, nothing is told of the many thousands of the more healthy ones that are *unseen* beneath the surface of these large rapid, turbid rivers, in the swollen bodies of which from freshets at that time of the year, the salmon are carried almost perforce down to the ocean, when in due time they recruit themselves, and are again prepared to renew this annual demand upon their nature in order to maintain their species. If the theory were true that all these salmon died in the rivers after spawning, their race must have become extinct long before this. It is considered opportune to refer to this singular mortality among salmon, with the view to impart some information on the subject to fishermen and others who may not be aware of the fact; and to rebut in a measure the false statements which have been disseminated broadcast among the inhabitants on the Restigouche River by wickedly disposed opponents to the science of fish culture, who allege that, because a few fish may at times be found dead, dying or sickly in the river, this result has been wholly brought about by operations at the hatchery in handling salmon for artificial purposes. The allegation is not only groundless, but events have shown that it was conceived in wickedness and malice, in order to injure and defame, not only the officers engaged in the work at the hatcheries, but, the very industry itself. How, it may be asked is it that, such great mortality is found among salmon in the Fraser and other rivers on the Pacific slope where hatcheries have never been worked? The same may be said of many of the rivers of Britain where the death rate of salmon is alarming and with no breeding establishments upon them either.

In further evidence of the remarks which I have made on this subject, I here quote the statement of Mr. Lumsden, Superintendent of the Tay salmon fishing in Scotland, who speaks of the Tay fishing in November and December just past, as follows:—"The salmon disease has again proved very destructive. During the fishing season the salmon were supposed to be quite free from the disorder; but unfortunately when netting operations for the collection of eggs for scientific purposes commenced, many fish were taken suffering from the fungus, and as time went on the number of diseased fish increased. During November and December as many as (704) seven hundred and four salmon, grise and trout were found dead in the river.

* * * * * * *

Capturing Parent Salmon.

There were (186) one hundred and eighty-six parent salmon obtained from the net which was set at the newly formed stand, close by the reception pond at the head of tide water. This fishing station was never used before. The fishermen considering it of little or no use, on account of its situation being in a shallow channel, up which, only a few straggling fish were supposed to pass; at the time of selecting the site for the reservoir, just along this blind channel (as it were) of the river, it was thought expedient to make a trial of this place, and learn whether salmon could be caught in any numbers there by setting a net, with a proper trap affixed to it. This idea has proved satisfactory in a greater degree than originally contemplated; for during the past season the above mentioned number of salmon was actually taken in this channel; unfortunately, however, they were all small sized fish, a large number being *grilse*. It would appear that the large, full grown salmon, take the two larger

thwarted. For the countless thousands of these large, (at other times) voracious fish on their journey up to their nurseries to reproduce their kind, would meet their broods of young of the former years coming down as "parrs," as "smolts," to the sea and devour them, thus actually destroying the very object for which the Great Creator had originally so wisely ordained all things.

and deeper parts of the river, called the north and south channels. In each of these, several important fishing stations are located. They are held by lessees from your Department, with whom from the first it was contemplated to make arrangements by which the necessary supplies (over and above those taken at our station) of salmon would be obtained to stock the hatchery with eggs.

At the present time negotiations are in progress by which two of the best salmon stands on the north channel, quite near to the retaining pond, will be obtained. From these, judging from the usual annual returns of fish taken at them, it is confidently expected that ample supplies of breeding salmon will always be had in future years.

Of the above number of fish secured, only seventy-eight (78) were females; the balance were made up of males and grilse, and the fish throughout were of an unusually small size; consequently they yielded a less number of eggs than the average quantity generally obtained from the Restigouche salmon. Seven hundred thousand (700,000) ova were the total number gathered. These were deposited in the hatchery at Deeside, where, from last accounts, they were in a healthy state and doing very well. The returns show a crop of nine hundred and forty thousand (940,000) salmon fry, from the eggs laid down in the fall of 1883. These were distributed widely. Two hundred thousand (200,000) were put in the Nipissiquit River through the instrumentality of Mr. Burns, M.P., for Gloucester County. The work of planting these fry was performed most satisfactorily, being aided by the zealous efforts and personal assistance of J. DeWolf Spurr, Esq., of St. John. This gentleman expressed great satisfaction with the healthy state of the young fish after their journey by railway from Metapedia, and the safe delivery of them afterwards in the upper parts of the Nipissiquit river. In addition to this lot of fry, and the forwarding of 400,000 eggs to the St. John river hatchery, there remained some 740,000 fry, which were planted in the waters of the Patapedia, Upsalquitch, Metapedia and main Restigouche, making a total of 940,000 fry and 400,000 vitalized eggs put out of this hatchery in 1884.

Total of fry hatched spring of 1884.....	940,000
Total of eggs laid down fall of 1884.....	700,000

NOTE.—In the report on the Restigouche Hatchery in the appendix will be found very pertinent remarks concerning the irregular returns of salmon caught by the nets; and the excessive fishing carried on by trap-nets along the coast. A record is also given of the catch of salmon by anglers on the Restigouche, which gives the number taken at seventeen hundred (1,700) fish, weighing 37,000 pounds, or an average of about 21½ pounds each.

VIII.—GASPÉ HATCHERY, P. Q.

This institution for salmon breeding, situated on the estuary of the Dartmouth River, about three miles from Gaspé Basin, was visited by me in company with Yourself in July last. Upon an inspection of the hatchery, it was found necessary to order certain repairs. The lower floor required renewing throughout. New hatching troughs were required; other matters of minor importance needed overhauling. The improvements were at once entered upon, and were completed in time for the autumn work of laying in the stock of eggs. The officer in charge now reports the hatchery in good working order.

The retaining pond in which the parent salmon are kept till ripe for spawning, is formed by taking in a portion of a small brook several miles up river from the site of the hatchery. This inclosure has been in use for retaining salmon for several years, and has proved very satisfactory. The plan pursued is to catch the salmon from the early runs going up the Dartmouth River in June and July, by means of a trap net set just at the head of the tide water. The fish are carefully taken from the trap and put into scows through which the water passes freely, and then floated

to the retaining pond, and there kept till required for spawning purposes in October and November. They are then returned to the river when they quickly go to sea.

At the time of inspecting these works an unusually heavy freshet was running, which prevented the possibility of seeing the whole complement of fish that had been put in the pen. A small breakage was noticed in the pond, through which during the very high water some few fish no doubt must have escaped. This method of impounding parent salmon for spawning purposes is by all odds superior to the slavish and injurious plan of capturing them on the spawning beds up river late in the autumn, and wherever found practicable to apply the pond system, to any or all of the hatcheries, it should be adopted, and if it were possible to construct these ponds in places where purely tidal salt water would freely ebb and flow through them, they would be found to answer the purpose much better for keeping salmon free from disease of any kind, than when retained in fresh water, on account of the greater salubrity of the salt water for sustaining health and vigour in the fish until required for spawning. Ten years' trial in keeping parent salmon in a salt water pond at the Tadoussac Hatchery in Quebec, has proved this system to be the most effective beyond all doubt.

The number of salmon netted for the use of the Gaspé Hatchery on the Dartmouth River was smaller than usual, occasioned by the necessity of taking up the net during the prevalence for some time, of an unprecedented freshet in the river in July last; only one hundred and five (105) were taken and twenty of these escaped from the pond during the freshet, leaving only 85; of these 38 were females and 47 were males; the former gave two hundred and forty-five thousand (245,000) eggs. In order to supplement the Dartmouth River supply, twenty six (26) salmon were netted in the Barachois River, late in the season, fifteen of these were females; they gave ninety-six thousand (96,000) eggs, thus making the total number of ova for the Gaspé Hatchery, three hundred and forty-one thousand (341,000) forming an average to each fish of six thousand four hundred and thirty (6,430) eggs. The officer in charge reports the stock of eggs in good condition at the present time. A large percentage of young fish were hatched from the ova laid down the previous season of 1883; eight hundred and fifty-nine thousand (859,000) salmon fry were distributed from the Gaspé Hatchery, in the spring of 1884 in the Dartmouth, York, St. John, and Grand Rivers, in the County of Gaspé. A satisfactory evidence is here given of the benefits arising from the planting of young salmon in the Grand River which were obtained from the hatchery. Colonel Walker, a well known angler, is lessee of the Grand River, he writes thus: "I think it an ascertained fact beyond doubt that, the majority of salmon now being caught in this river, are the result of stocking it with fry from the Gaspé Hatchery."

Total of fry turned out spring 1884.....	859,000
Total of eggs laid down fall of 1884.....	341,000

IX.—TADOUSSAC HATCHERY.

This establishment is located alongside a little nook, or cove, surrounded by the rocky banks of the Saguenay River, just at its entrance into the St. Lawrence. The works are somewhat extensively formed here, consisting of a large building with two floors fitted up with hatching troughs, tanks and other apparatus, for conveniently breeding young salmon on an extensive scale.

The building stands upon a pier or wharf alongside which the Saguenay River steamers regularly call during navigation. The water for hatching purposes is supplied from a small lake among the rocky hills in the rear, at an elevation much higher than the site of the hatchery. A small brook forms the outlet of the lake, and runs through a deep fissure of the rocks, where several small nursery ponds are formed at intervals. From thence it is carried by means of an inclosed dall into the

building, and through the breeding troughs, and thence falls directly into the little salt water cove, or tidal waters of the Saguenay.

This small cove, or inlet, covers an area of about an acre, and is shut off from the open river by a weir across its outlet, thus forming a complete pen, or reservoir, in which the parent salmon are securely kept from May and June till spawning time in October and November. The ordinary tides here are about six feet, and at the ebb and flow rush rapidly in and out through a narrow gateway in the weir, forming, as it were, the rapid current of a river, in which, during the running of the tides, the salmon leap and play about, as if in their native river.

These salmon are captured in the ordinary kind of nets set along the coasts, only having small meshes in the trap, which prevents injury from gilling, and from abrasions, so frequently caused by the usual regulation nets; they are then carried in lattice work scows to the cove, where they remain during the whole season in purely salt water; and it is found, after a thoroughly practical trial of this system for many years at this establishment, that not only are losses of the fish hardly known, but it is also an ascertained fact that these parent fish are less liable to disease of any kind, and that their eggs are fully more certain of impregnation, than where collected at any of the other establishments. From these well established facts the recommendations in the foregoing report upon the Gaspé Hatchery were offered, viz: "That salt water reservoirs should be built in connection with such of the salmon nurseries, where it would be found practicable to do so." It has nevertheless been held by scientists and others who have written, or expressed opinions on the nature and habits of the salmon, that the ovaries of these fish would not mature in salt water; basing their conclusions, very justly too, upon the well-known fact that these fish invariably resort to the fresh water parts of rivers and streams to form their nests and lay their eggs, and also that a sojourn of some indefinite period of time in fresh water was absolutely requisite to ripen the eggs sufficiently for due impregnation at the time of spawning. The operations at the Tadoussac Salmon Hatchery, have undoubtedly upset this old theory. Not only are the experiments at this nursery conclusive upon this subject, but it may be also added that, from a practical study of the habits of the salmon, it has been found that, at many of the smaller streams which empty directly into the sea, salmon will remain outside in the salt water till October and November, when, at the full maturity of their ova and milt, they will rush up these streams, forcing themselves at times almost out of the water on the shallows and bars formed from drought and other causes, and in some cases they will only spend a few days, or even hours, in the performance of spawning, and then return to sea again.

This hatchery, with its reservoir, dams, ponds and works generally, were thoroughly inspected by me, in company with Yourself, in July last. The usual annual cleaning of troughs, varnishing of trays, etc., was then going on. Some small repairs were requisite upon the dams which formed the small nursery ponds. The general status of the whole establishment, however, was at that time satisfactory. Some casualties are reported since from the results of a heavy gale, and high tides in the middle of November, doing damage to the wharves around the building. This, with some repairs to the floors and tanks in the hatchery, will be required next year. The isolated position of these works, shut up as it were from the outer world from the close to the opening of navigation, making seven or eight months of almost arctic weather, gives additional anxiety to the officer in charge of this hatchery for its safety during the inclemency of winter. From the cautious forethought, however, of Mr. Radford, success has very fairly attended this institution from its commencement.

Two hundred and seven (207) parent salmon were caught outside the Saguenay, in the St. Lawrence, and placed in the cove, or reservoir above mentioned. The stormy weather prevented satisfactory fishing with the nets, and reduced the usual catch of fish for this nursery. Here, as well as at all the hatcheries, the salmon proved to be of smaller size than in former years. One hundred and seven (107) were females; from these seven hundred and seventy-five thousand (775,000) eggs were

placed on the hatching trays. An average of seven thousand two hundred and fifty (7,250) eggs were got from each female. They were under-sized fish, only averaging about eleven pounds each. The officer reports these eggs in good condition, with a very slight percentage of loss up to the present time.

Nine hundred and eighty-five thousand (985,000) salmon fry were distributed from the Tadoussac Hatchery during the season of 1884, in the following rivers: St. Margaret North-West Branch, St. Margaret North-East Branch, Petit Saguenay, L'Anse St. Jean, and Petit Isle Rivers, and in the small streams running into the lake, and nursery ponds near the hatchery.

Total number of fry turned out in spring of 1884.....	985,000
Total number of eggs laid down in the fall of 1884.....	775,000

X. — MAGOG HATCHERY.

The original Magog Hatchery was built at the outlet of Lake Memphramagog on the Magog River. It was intended more especially for the artificial breeding of salmon trout, commonly called "*lunge*" in the Eastern Townships of Quebec. The works were nevertheless well adapted for the rearing of other descriptions of fish. White-fish, salmon, and trout eggs, in large numbers have been sent to this establishment from its commencement with success, from the Newcastle Hatchery in Ontario.

The site originally selected and built upon proved to be well adapted for fish breeding purposes, having every convenience necessary. But from the action of the company owning the surrounding property and water privileges, the first site was changed for one lower down the river. The location of this new site, and all matters relating to the substituted establishment were selected, and carried out by your late commissioner, W. F. Whitcher. I cannot speak from personal knowledge of anything relating to these newly erected works, as I have not seen them. The officer in charge however, reports "everything in good order so far as relates to the "hatchery buildings, machinery, and water; but, still further work in the building of "fences around the grounds, and the construction of pens, may be required."

The extensive chain of lakes and streams, so widely spread throughout the region of the Eastern Townships, once famous for their abundant supplies of fish, but latterly almost depleted, urgently demand the most vigorous application of the law, for their protection. Strenuous efforts should also be put forth to restock and improve these waters, with the more valuable kinds of fish, both by the natural, and artificial methods of propagation.

The operations at the Magog establishment in the fall of 1883, amounted to a catch of one hundred and eighty (180) salmon trout (*lunge*). The female portion of these, gave one hundred and fifty thousand (150,000) eggs, which were laid on the trays. Difficulties of an unfortunate nature transpired with these eggs, brought about by the "Magog Water Company" only partially completing their lower dams, which prevented operations being carried on in the new hatchery, and also seriously affected the work in the old one by overflowing the floors at times several feet in depth; eventually necessitating, as the officer in charge reports, "the planting of the fry before their full development in Lake Memphramagog."

The business of catching parent fish last fall in Lake Memphramagog was somewhat unsuccessful, on account of stormy weather, which prevented the use of nets at the time the fish were on the shoals and spawning grounds; consequently a very trifling supply of eggs had been obtained, and the officer in charge reports that:—"He will have to depend upon other sources for a supply of eggs."

With regard to the benefits which have resulted from the work already done at the Magog Hatchery, reference is made to several letters in the Magog report in the Appendix, where it will be found that satisfactory statements are given by several residents relative to improvements in the fisheries, and credit is there given to the Magog Hatchery for a large share of this success.

PROVINCE OF ONTARIO.

XI.—NEWCASTLE HATCHERY.

This establishment was the primary institution built in Canada for the artificial propagation of fish. At first it was commenced in a small way, as an experimental nursery for rearing salmon. This first venture proved to be of an eminently practical and satisfactory character, and has been applied since to the several Provinces in the Dominion by the construction and complete working of twelve fish-breeding establishments.

The original experiments with salmon eggs quickly spread to other species of fish, such as white fish, salmon trout, pickerel (dore, or wall-eyed pike), black bass, and other fresh water fishes. The ova of these fish have been extensively hatched at the Newcastle Hatchery, where the operations have grown to the rearing and distributing of many millions of fry annually.

Of late years the whole working capacity of this hatchery has been directed to breeding fish of the greatest commercial importance to, and most suitable for, the waters of the inland lakes and rivers of Ontario; consequently the rearing of salmon has not been pursued here for several years past. Being of the anadromous or migratory species, they enter streams to lay their eggs for reproductive purposes. These breeding streams have become so changed of late in temperature and purity during the hot summer months as to cause the death of young salmon; hence the discontinuance of artificially breeding a description of fish in this nursery that practical experience has shown cannot withstand the climatic effects upon the generally reduced flow of water in the streams of Ontario.

From the experiments worked out at this establishment, a thoroughly practical system of artificial fish culture has been originated in Canada, and many of the most highly approved kinds of apparatus used in fish-breeding have been invented. This system and these appliances are used in all the establishments of the Dominion; and likewise in many other fish breeding institutions in different parts of the world. A complete working section of the system in use at this nursery was put in operation at the "Great International Fisheries Exhibition, London, 1883," where its practical utility and superiority over all other methods was demonstrated by the hatching of young salmon, and growing them to parrs, during the six months period of the exhibition, and by obtaining the gold medal and diploma for the best and most complete fish-breeding establishment in the exhibition.

Repairs to Building.

It was found absolutely necessary to make many repairs and renewals of certain parts of the building and machinery connected with this hatchery. The constant moisture to the sills, floors and parts of the building during the past twelve years, had produced decay to such an extent as to demand a complete renewal. This work, together with making new hatching troughs and tanks throughout, and repairing of conducting pipes and waterworks, was performed during the past summer. These improvements now put the hatchery in a perfect and permanent position, and will ensure its reliability for all purposes for many years to come.

With the increased demand for young fish from this establishment for stocking numerous waters in Ontario, and for the greater safety for keeping them in a more healthy state after emerging from the egg, until the time for distributing them; and for supplying the ponds with colder and purer water than is obtainable at the present time; it will be found absolutely necessary to devise means for procuring a certain supply of pure spring or well water, and the only plan which presents itself to accomplish this end is the boring for an artesian well, from which it is contemplated this want of pure water would be overcome. These artesian wells are now being utilized in many sections of the country, and are cheaply made; one sunk here would render essential service in the proper working of this establishment, and should be entered upon at once, or so soon as the early spring will permit.

Carp Ponds.

Demands for carp to stock waters in the Dominion are being frequently made. To meet this want it will be necessary to improve the present ponds by deepening them sufficiently to ensure the safety of the parent fish against the extreme frosts of winter. A trial was made in breeding these fish in 1881-82 by obtaining a number of very small fry from the carp ponds at Washington, D.C.; these were donated to your Department by the kindness of Prof. Baird, whose generosity in similar matters has often been experienced on former occasions. Some of these carp grew very rapidly during the first summer, but nearly all succumbed, from the ice penetrating to the bottom of these very shallow ponds, by the severity of the winter. A few specimens were found in the spring of 1883 weighing a couple of pounds, which shows the rapid growth of these fish even under adverse circumstances; there is no doubt if the ponds had been sufficiently deep in the centre to prevent freezing to the bottom, large quantities of these fish could have been distributed throughout the country from the stock originally obtained. The carp are very prolific and flourish even in turbid waters of a high temperature; on this account they would be well adapted for many waters in this country unsuitable now for the rearing of the salmon family. The expense in deepening these ponds would not be much; by drawing off the water in the early spring, exposure to the sun would dry them up sufficiently when the work could be performed cheaply and expeditiously during next summer.

Collecting Eggs.

Increasing difficulties are being experienced annually in relation to procuring requisite supplies of salmon trout eggs for the uses of the Newcastle Hatchery; with the more numerous demands that are made every season by Representatives from all parts of the Province to procure young fish to stock and improve the rapidly declining fisheries of the country, comes also from certain localities strong opposition to the system pursued by your Department in granting permits to officers of this institution to obtain fish and fishspawn during the close time.

In meeting these objections which, if literally applied to all the fisheries of the country, and if by "close time" is meant "spawning time," which no doubt was the original intention of the term; then the objections hold good, and the admitted injury to the fisheries from this cause should be immediately prevented. For it is conclusive to the minds of all persons practically acquainted with the fisheries of the country and the habits of the fish that, this constant destruction of fish during their breeding seasons has been and is now the chief and paramount cause of the great falling off of the fisheries in many localities, and the total destruction of them in other places; and not until a thorough change is made, with regard to the times and modes of capturing fish in the waters of Ontario (and it may be added in the other Provinces also) together with an absolute enforcement of the law appertaining to the same, beyond the interference of local or party influences, can it be expected that any improvements whatever will take place in the more important fresh water fisheries of the country; but on the contrary they must and will go on declining, year after year, until they become so depleted of the better descriptions of fish as to be wholly given up for commercial purposes.

Notwithstanding the complaints which have been made concerning the taking of fish and fish spawn during the "close time" through permits from your Department, no diminution takes place during the same time in the fishing carried on by the fishermen in the neighbourhood from whence these complaints originate. It is well understood, through a tacit consent of the overseers, that nets which are set in the open season may be taken up during the close season; whereupon every available net is sure to be put down just before the close time commences. Several days may pass before these nets are lifted, especially if stormy weather prevails, which is usually the case about the beginning of November; in this way the nets may remain out during the greater and in some instances the whole period of the close season; so that let the weather be favourable or unfavourable fishing is actually going on,

more or less, during the whole period forming the close season, namely, from the 1st to the 10th of November, thus practically demonstrating the statements generally made and believed in by the fishermen themselves that, rather than have a "close time" so short and "so violated," better not have one at all.

A close time that would prove to be of service for the maintenance of the salmon trout fisheries of the Province, should commence about the 15th or 20th of October, and continue until about the 15th or 20th of November, or it might run to the 1st of January, or the 1st of April following, for practically speaking no fishing can well be, or in fact is, pursued after the 20th of November, on account of cold, inclement weather. Every honest conscientious fisherman will endorse this view of the matter to be correct; and he will furthermore say that the losses in nets, boats, time and fishing gear generally, after the 10th of November, are in the great majority of cases fully more than the profits, and if a close time as above named were made and enforced to the very letter throughout the Province everywhere alike, it would be in their interests to have it done. But as the close time at present is so short and only nominal in its application, and may be kept or violated at pleasure in certain sections of the country, depending upon the nominal surveillance and, in some instances, tacit permission of the fishery overseer, whose occupation may be such and his residence so distant from the fishing point, that little or nothing is known about these infractions of the law.

Some of the more shrewd and crafty fishermen, and others engaged in the fish trade, whose interests are wholly identified with the catch and traffic of fish for the present time only, and not caring for the future welfare of the fisheries of the country, represent to your Department and to the legislators of the country that close seasons for fish are unnecessary; or, if required, they should be so fixed as best not to interfere with the fishing trade, or their avaricious desires to capture them, when most numerous congregated together for actual spawning purposes. Again, they say why hamper us with fishery laws and close seasons, when artificial culture is turning out annually so many millions of young fish from the hatcheries? Here again is another cunning pretext to obtain further license to kill and destroy fish at all times, by putting forth the fallacy that artificial breeding can outdo and supplant nature in the maintenance of the fisheries of the country.

Artificial breeding of fish can be made, and is no doubt a decided auxiliary to the natural production, but its benefits should not be over-rated to such an extent as to make its results fabulous. This view is nevertheless disseminated by persons having directly opposite ends to serve and from different motives. The enthusiastic well-wisher, for the maintenance of the fisheries for the present and the future, on entering the nursery and seeing millions of newly-hatched fry in the breeding troughs, at once heralds forth the idea that the effect of the fish-hatcheries will be to fill the waters of the country again with fish, as of former years. And the greedy calculating fisherman, caring nothing for the benefit of the fisheries in the future, but only how he may obtain the greater number for the present to enrich himself, also becomes the strong advocate of artificial fish-breeding as a speedy means of replenishing the waters; and with this pretext, he pleads for the abrogation of all restrictions and close times for protecting fish, in order to partake of greater freedom in the exercise of his cupidity in the destruction of greater quantities of them.

There are also public and private bodies and individuals, who express much interest for the welfare of the fisheries: each, however, taking in many instances divergent views of the matter. Some corporations in which numbers of fishermen reside advocate fishery laws, and particularly "close seasons," to be so framed as to suit the wants and conveniences of the poor fishermen, as they are styled. These "wants and conveniences" mean simply a greater privilege to capture the pregnant mother fish, laden with fruitful eggs, as they approach the shallower waters near the shores to lay their ova for increasing their species. And so it is with many individuals, who daily see hundreds and hundreds of gravid fish caught and placed in the markets for sale, with thousands of ripe, fruitful eggs streaming from their bodies, and yet pass them by without notice or comment; but if some comparatively trifling

infringement of the law takes place, or if in carrying out a necessary work to supply eggs for the hatcheries, strong objections are raised by fishermen and others for interfering with the Fisheries' Act. But go to the cities and towns, visit the fishing grounds, the wharfs and landing places, where fishermen catch and bring in their fish in October and November, and there will be seen thousands of salmon trout, mother fish, laden with ripe eggs; and the fishing stalls, boats and the men themselves besmeared with ripe fish eggs which have been extruded from the bodies of the fish just captured—yet not a word is said about it.

Now all this could not take place were a "proper close time" established; neither would gravid, unwholesome food of this kind be thrown upon the markets for consumption, and instead of the hundreds of millions of ripe eggs which are destroyed in this way, they would be laid on the natural spawning grounds, where the proportion husbanded by nature would produce immense crops of young fish, which in due time would grow to maturity, and supply a sure means of sustaining a reasonable traffic in fish, not only for the present time, but for the future.

No defence will be put up for taking mature fish from the spawning beds during the close season even for the hatcheries, for in any case the killing of ripe, pregnant fish cannot be upheld. But if the fishermen are allowed to take the salmon trout in thousands upon thousands for the markets of the country during the very hottest period of their spawning time, and also in many cases all through the nominal close season, the securing of a few of these same fish at this time, for stocking the Government hatcheries with eggs, cannot fairly or reasonably be objected to.

But if the exigencies of the case require a change from the method hitherto adopted in getting supplies of ova for the hatcheries, the only course which presents itself as likely to succeed will be to adopt similar measures as are in use at Tadoussac, Gaspé, and the Restigouche for obtaining parent salmon for stocking those institutions with eggs. It will be difficult, however, to conclude until an experiment is made whether the salmon trout of our lakes can be dealt with in like manner as the salmon of the sea, as the latter are of the migratory species, leaving the salt water for fresh water rivers only for breeding purposes, and from the peculiarity of their nature in taking no food while in fresh waters, they can, therefore, be retained in reservoirs or ponds of limited size, without entailing any expense or trouble in keeping them through the summer till spawning time, except protection from marauders and others. The salmon trout on the other hand do not leave the lakes for rivers, but resort to shoals and reefs in certain parts of the lakes, generally near shore, where they congregate in great numbers in order to perfect their spawning operations by close commingling of their sexes. During the summer and up to the spawning time they are constantly feeding. It will, therefore, be somewhat doubtful whether similar success will attend impounding salmon trout in small areas of water for artificial breeding purposes, as has resulted from this procedure with the salmon of the Maritime Provinces.

If therefore it be intended to thoroughly protect and improve the lake fisheries of this Province by setting aside proper "close seasons" to cover the actual spawning times of this most important commercial fish of the lakes, without molestation of any kind; it will be necessary at the same time to make arrangements for securing some suitable inlet, or bay, where it could be surrounded in some manner, so as to form an extensive inclosure, or pen, in which large numbers of salmon-trout could be securely impounded till they became ripe for spawning. This plan would necessitate the procuring of suitable trap-nets, and other material, and also employment of fishermen to work them, in order to capture such numbers of fish during the open season, as might be required to furnish the necessary quantities of eggs for the hatcheries; by these means it might be practicable to satisfy the numerous demands which are annually made upon your Department, for young fish to fill depleted and other waters in the country.

If however on the other hand the same policy is to continue, by having simply a nominal "close time" and that fishermen will still be permitted to kill salmon trout in the same wholesale manner now practised during the spawning time of these fish. Surely the officers of the fish breeding establishments should also be allowed

to continue the system hitherto adopted for getting their supplies of fish-eggs, for the several Government fish hatcheries. With a comparison made of the effect produced upon the fisheries, by these two operations at the spawning time, the result would be that, the fishermen in the capture of every female fish of an average of four pound weight would destroy about three thousand (3,000) fruitful fish eggs, ripe and ready to be laid for multiplying their species. The officer of the fish hatchery might, or might not kill the parent fish, but in either case would save the 3,000 eggs, from which he would return to the waters of the country at the very lowest calculation 2,000 living fry. Further proof, nor reasoning is necessary, to convince even the prejudiced mind, in favour of protecting the valuable food-fishes of the country by establishing proper close seasons in which these fish may escape the inhuman slaughter they are subjected to, while engaged in the very act of multiplying their numbers for the rational, not the avaricious, or destructive uses of mankind.

Crop of Fry and Eggs.—Season of 1884.

The quantity of ova obtained for the Newcastle Hatchery the past autumn, was not as great as in 1883. This falling off was occasioned by the great difficulty experienced in getting the ordinary supplies of parent fish at Pigeon Island, in Lake Ontario; and in the Georgian Bay, in Lake Huron; rough, inclement weather prevailed, this coupled with difficulties concerning the taking of eggs in the close season caused a less number of eggs, to be gathered. There were, however, about four millions (4,000,000) of salmon trout ova obtained at the above named places; these at the present time are in a very healthy condition. There are also some three and a-half million (3,500,000) of white fish eggs in process of hatching in the incubators; these were obtained from the Sandwich establishment. In addition to these, there are also about fifty thousand (50,000) speckled trout eggs, which were got from the Tadoussac Hatchery. These give a total of seven million five hundred and fifty thousand (7,550,000) eggs of all kinds in the Newcastle Hatchery.

A very large and satisfactory crop of young fish of various species were turned out of this nursery last spring or season of 1884, they were of the following kinds, namely:—

Salmon trout—Five million one hundred and fifty thousand (5,150,000).

White fish—Three million five hundred thousand (3,500,000).

Speckled trout—Fifty thousand (50,000).

Black bass—One hundred thousand (100,000).

These fry were distributed (particularly the young salmon trout) in almost every county in Ontario, where water areas were of sufficient magnitude, and of proper adaptation for their future development. Some of the fry were also distributed in the Province of Quebec; and a lot of the white fish ova were sent to lakes in Scotland, at the request of the Marquis of Lorne, where they arrived in splendid condition, and after hatching were placed in some of the Scottish lakes on the Marquis' estates.

Reference is made to the report of the officers in charge, in the Appendix, where a detailed account will be found of the numerous points where young fish were distributed from this hatchery, and where suggestions are offered regarding the plan for the distribution of fry in the future.

Total number of fry of all kinds turned out of this nursery during the season of 1884.....	8,800,000
The total number of fish eggs of all kinds laid down in this hatchery in the fall of 1884, was.....	7,550,000

XII.—SANDWICH HATCHERY.

This somewhat extensive nursery was originally built for the artificial propagation of white fish, but in addition to this species large numbers of lake pickerel (wall-eyed pike, dore) (*lucioperca*) have of late years been hatched at the Sandwich Hatchery. The establishment is located just below the Town of Sandwich, on the Detroit River, and is worked by steam as the motive power for pumping water from the river to run the glass incubators for hatching fish eggs and for all other purposes of the institution.

The glass self-picking jars used here are the outcome from the first and original self-picking and self-cleaning fish egg incubator invented. The primary patent of invention was obtained for Canada and the United States by the Department in April, 1876, in the name of the original inventor as "Wilmot's combined fish egg incubator, being a self-picker and self-cleaner, worked with an upward or downward flow of water at pleasure; manufactured of metal, glass, or earthenware." Since which time several improvements have been made in the mechanism of the jar or hatching vessel, but the original idea for constructing an automatic fish egg incubator has not been interfered with.

This method is now almost universally adopted as the best appliance for hatching the smaller kinds of fish eggs, and those of a buoyant and semi-buoyant nature. This principle is no doubt yet destined to be the medium, under certain modifications, by which fish eggs of every description will be artificially hatched in the future.

There has been turned out of this hatchery since its commencement, in 1876, up to the present time, upwards of two hundred millions (200,000,000) of young white fish and pickerel. Of this number one hundred and fifty-eight million nine hundred and forty thousand (158,940,000) were white fish and seventy-seven millions (77,000,000) were pickerel; making in all a grand total of two hundred and thirty-five million nine hundred and forty thousand (235,940,000) fry of two valuable descriptions of fish, that are of great commercial importance to the country.

It is too often found that the sceptic in ignorance, party fervour, or self-conceit will decry the very best of undertakings which, just for the time, may not show immediate results to gratify his covetous desires or subvert his envious feelings. This spirit has been shown in some instances in the Dominion against the science of artificial fish-breeding by certain writers and others of that character, simply because they cannot comprehend, nor do they wish to rationally consider the practical bearings of the subject; they merely jump at hasty conclusions, because they cannot, perhaps, either see, catch or enjoy the fruits of an industry just at the call of their own hasty will and pleasure. Nevertheless, here from one establishment alone, within the past few years, an actual saving of upwards of two hundred millions of young fish, bred by this somewhat decried method, have been distributed in many of the waters of the country, everyone of which would otherwise have been irrecoverably lost. Now from this large yield of young fish over and above every other source of production, it must surely be held that, in the ordinary course of nature, a certain percentage of them must not only have reached the adult state to reproduce their species, but also must have materially assisted in upholding the general supply of fish food required for domestic purposes and commercial traffic.

In evidence of the above reasonable conclusion, it may be stated here that certain numbers of the eggs which produced a portion of the above-mentioned quantity of young fry, were transferred from the Sandwich hatchery to other nurseries in the country where the fry were hatched and transported hundreds of miles away to waters in which these fish were not indigenous or in fact were never known before, and there it is known, without doubt, that they have grown to a sufficient size to be caught and used for food. There are instances also in which white-fish have grown from the egg state upward to quite a size, even to a pound weight, in small artificial ponds with a surface area of only a few feet. Now, with this undoubted evidence of the growth of artificially bred white-fish from a few thousand of these eggs to edible or adult size in ponds and lakes in which they were not indigenous, what right has

the sceptic or the selfish opponent to artificial fish culture, or in fact anyone to doubt the benefits to be derived from the hundreds of millions of other fry which have for years past been planted in the pure waters of our magnificent lakes where it has always been their habitat for reproductive purposes and all other requirements of their nature.

It is pleasing however to find that, in the immediate neighbourhood of the Sandwich Hatchery, the greatest satisfaction is expressed in favour of its usefulness. A memorial will be found attached to the Sandwich report in the Appendix, setting forth the views entertained by the leading persons of that neighbourhood who "desire" to express their belief in the benefits which are derivable, and which have been "realised from the large number of young white fish and pickerel which have been bred and turned out from the Government fish hatchery at Sandwich; and further" that, the Government in its wisdom is looking to the interests of the people of the "country in the maintenance of the said hatchery."

Distribution of Fry.—Spring of 1884.

In summing up the operations at Sandwich for the past year it will be found that in the spring of 1884 some ten millions (10,000,000) of young pickerel were hatched there and distributed in the Detroit and St. Clair Rivers, and that in addition to these pickerel fry, twenty-seven millions (27,000,000) of young white fish were bred and planted in the following named places:—At Peach Island, Fighting Island, Bois Blanc Island, Belle Isle, and opposite the hatchery in the Detroit River: at Leamington, Pelee Island, Port Stanley, Pigeon Bay, and at points in Kent County, on Lake Erie: at Meaford, in the Georgian Bay, and at Niagara and other places on Lake Ontario.

Collection of Eggs.—Fall of 1884.

During the past fall there was obtained for this hatchery upwards of fifty millions (50,000,000) of white fish eggs. They were collected at the Bois Blanc Island and Stony Island fisheries. These were put in the incubators in good order. The officer in charge says: "These eggs are looking well and are in a healthy condition, and from the satisfactory working of 'Wilmot's Automatic Glass Jars' I expect to hatch a large percentage of fry in the coming spring of 1885."

Improvements.

An inspection of the Sandwich establishment was made by me last summer. The steam engine, pumps, machinery and appliances generally, were in a fair state of repair. The recommendations formerly made for procuring another engine to supplement the present one in case of accident, or emergencies of any kind, were more strongly impressed upon me than before; as also the want of a larger conducting pipe for carrying water into the hatchery from the river. These necessities are indispensably requisite to insure perfect safety during the period in which the process of hatching is going on, with the millions of eggs that are put in the incubators of the Sandwich Hatchery annually.

The breakage of any part of the engine from any unforeseen cause, would prevent the working of the pumps and consequently a stoppage of the flow of water through the eggs in the incubators. In the event of any misfortune of this kind, which might take place at any moment, the whole supply of eggs in the nursery would undoubtedly be lost, but with a supplementary engine at hand a disaster of this serious nature would be prevented. With regard to the enlargement of the water supply with the present conductor pipe, temporary repairs have been made to last over the present hatching season, when a new pipe will be laid down next summer.

An additional supply of these "automatic glass incubators" was obtained last fall to meet the requirements of the increased quantity of eggs collected. These jars

were set up in a temporary manner with the view to their being re-arranged at the time of the general repairs proposed to be made in the establishment next season.

Total number of young white fish turned out in the spring of 1884 27,000,000

Total number of young pickerel turned out in the spring of 1884 10,000,000

Total number of white fish eggs laid down in fall of 1884..... 50,000,000

REMARKS ON THE APPLICATION AND RESULTS OF ARTIFICIAL SALMON CULTURE IN THE SALMON FISHERIES IN THE MARITIME PROVINCES.

Artificial Salmon Culture. Its practical application, and results on the Salmon Fisheries in the Dominion of Canada; with extracts from official reports, and remarks thereon.

The following statement of returns and figures relative to the salmon fisheries of the Maritime Provinces in the Dominion of Canada for 1881, 1882 and 1883, will show the increase in the catch of salmon in districts where artificial propagation has been applied; and the comparative decrease in the salmon fisheries where the operations of the breeding establishments have not been applied.

In order to give information relative to the application of these fishery returns and figures under consideration, and to explain why the official reports of 1881-82 and 1883 are specially referred to, it will be necessary to state that they are the latest public records from which it would be possible to obtain the desired authentic information, and that they also cover the probable periods when the first realisation of beneficial effects would be felt in a limited way from the planting of artificially bred salmon in the rivers and streams of the several fishery districts herein referred to.

These particulars are taken from the official reports forwarded to your Department by the Inspectors of fisheries in these Provinces, and from the returns of numerous fishery overseers, all of whom have no doubt given their information from public motives, and for the general welfare of the fishing districts under their immediate jurisdiction, irrespective, too, in most instances of any knowledge by the overseers of the operations of artificial fish breeding being applied to many of the rivers, streams and fishery divisions reported upon.

It is somewhat remarkable that the fishery reports containing this information had not been examined in a cursory manner, at least, by certain critics before the uncalled for remarks were uttered against artificial fish-breeding by certain representatives in Parliament, by contributors to the press, wholly ignorant of the subject; and by present and past officers of your Department, all of whom, from motives best known to themselves (certainly not in the interests of the country), thought proper to condemn a young and growing industry in the Dominion, before it had reached the full period when its usefulness could be shown and felt; especially, too, when at the same time as a matter of fact, and of history, it was known that unmistakable benefits had resulted from its operations, not only here in Canada but also in many of the leading countries in the world where the science of artificial fish culture was extensively carried on and generously fostered by the State. And furthermore when it was also known that from this industry had sprung "The Great International Fisheries Exhibition, London, 1883"—an exposition unparalleled for its wonderful exhibit of all fishery appliances, and unique as an educator to the world regarding the immense sources of food and of wealth obtainable from the water; at which Canada stood especially foremost among all the nations for her superiority in the practical display of the methods of artificial fish-breeding, and succeeded also in carrying away from all other competitors there the highest possible award—"The Gold Medal and Diploma for the best and most complete Fish-Breeding Establishment in the Exhibition."

The annual reports, and the statistics alluded to will show:—

(1.) That in the fishery divisions of the Counties of Gaspé, Bonaventure, Restigouche, and Gloucester, in the Provinces of Quebec and New Brunswick, which

border upon the Bay des Chaleurs, where the benefits from the Gaspé and Restigouche salmon hatcheries have been regularly applied since their commencement in 1874, and 1875, the official returns from 1881 to 1883, inclusive, show an increase in the catch of salmon in those counties collectively as follows:—

40½ per cent. increase in 1883 over 1881.

34½ per cent. increase in 1883, over 1882.

(2.) That in the Gaspé sub-division, in the Province of Quebec, which takes in the several rivers which have been stocked with salmon fry from the Gaspé Hatchery the official returns from 1881 to 1883 inclusive, show a continuous increase in the catch of salmon there as follows:—

211 per cent. increase in 1883, over 1881.

84 per cent. increase in 1883, over 1882.

68½ per cent. increase in 1882, over 1881.

(3.) That in the Restigouche sub-divisions, partly in Quebec and New Brunswick, which take in the tidal portions of the Restigouche River, and a part of the estuary fishings; where the proceeds of the Restigouche salmon hatchery have been regularly applied; a steady increase in the salmon catch is shown by the returns as follows:—

41 per cent. increase in 1883, over 1881.

45 per cent. increase in 1883 over 1882.

(4.) That in the North Shore divisions in the Province of Quebec, namely: Godbout, Trinity, Moisie, Mingan, Natashquan, Washecootai, St. Augustin, and Bonne Espérance; *where no benefits from artificial salmon breeding could be applied* (except on the Saguenay River); the returns from 1881 to 1883 inclusive, show the catch of salmon to be as follows:—

3½ per cent. decrease in 1882 under 1881.

24 per cent. decrease in 1883 under 1882.

That while the above named North Shore divisions collectively, show a falling off in the catch of salmon; yet that portion of the Saguenay division, which takes in the salmon fisheries of the Saguenay River; where the proceeds of the Tadoussac Hatchery have been given to its branches; the same returns, within the same years, show an increase as follows:—

66 per cent. increase in 1882 over 1881.

115 per cent. increase in 1883 over 1881.

(6.) That in the Northumberland fishery district in the Province of New Brunswick, which takes in the estuary and river fisheries of the Miramichi River, upon which a salmon-breeding establishment has been in operation since 1875, the returns show an increase from 1881 to 1883, inclusive, in the catch of salmon thus:—

95 per cent. increase in 1882 over 1881.

15 per cent. increase in 1883 over 1881.

(7.) That in the following counties in the Province of Nova Scotia, namely: Annapolis, Cumberland, Colchester, Guysboro, Halifax, Hants, King's, Lunenburg, Pictou and Queen's, in the rivers of which young salmon fry from the Bedford Hatchery have been distributed since 1876. The official returns show a large increase in the salmon fisheries from 1881 to 1883, inclusive, as follows:—

150 per cent. increase in 1882 over 1881.

120 per cent. increase in 1883 over 1881.

(8.) That in the following counties in the Province of Nova Scotia, namely: Antigonish, Cape Breton, Digby, Inverness, Richmond, Shelburne, Victoria and Yarmouth, where salmon fry have not been planted from the hatcheries, the returns show a very small increase in the salmon catch from 1881 to 1883, when compared with the counties where artificially bred fry have been planted, as follows:—

45 per cent. increase in 1882 over 1881.

40 per cent. increase in 1883 over 1881.

Thus it will be seen that in every instance where the localities have received supplies of artificially bred fry, a large increase in the catch of salmon is shown over those that have not received supplies of young salmon from the hatcheries.

Now whilst these official returns for 1881-82 and 1883 give undoubted evidence of an increased catch of salmon in all of the districts in the several Provinces where artificially bred fry *have been planted* since the commencement of their propagation in a small way in 1875-76 and 1877; they also show a decided decrease in the catch of these fish, at the same time, in the several districts where young salmon *have not been planted*. It is nevertheless a deplorable fact that all the salmon fisheries in the Atlantic Provinces have fallen off to an alarming extent from the general returns of former years.

It is not intended to be put forth here that this improvement of the salmon fisheries in the several districts where only moderate supplies of young salmon have been deposited in the rivers from the hatcheries, has been brought about wholly from artificial breeding; and it must not be gainsaid either, that these fish-breeding institutions are not entitled to a fair share of the credit for the results shown by these returns; for it could not so happen by any law or freak of nature of an accidental or co-incidental character that such a preponderating difference could take place between the various waters that were artificially stocked and those that were supplied by the natural process alone. Therefore it is but reasonable to conclude that the improvement in the fishery divisions described must have been the result of the influences of the natural and artificial methods of propagation combined, and this is all that has ever been advocated by the practical, intelligent and honest supporter of the science of artificial fish culture, as being a most useful adjunct, and an important subsidiary aid to the natural method which has been and is now so seriously interfered with by such a multitudinous number of destructive agencies as almost to forbid the possibility or power of man to control.

I cannot find words more apposite to describe the ruin going on in the fisheries, or to give the cause and the remedy for the evil, than in a former report of the Inspector of Fisheries for New Brunswick. I therefore quote briefly from it, where speaking of the alarming decrease in the stock of all anadromous fishes that frequent the waters of that Province, he says:—"They show beyond a doubt that this decrease has been brought about by wasteful and extravagant modes of fishing in some places, and by overfishing and insufficient protection everywhere. They show that these causes are still actually at work—that fishing operations are annually extending, while protection is annually becoming less; that all the causes which follow in the train of rapidly increasing population are in full and increasing activity. They show that everywhere, except where artificial culture has arrested the decrease, the salmon fishing is in the same danger."

EXTRACTS FROM ANNUAL REPORTS.

A few extracts are here given, which are taken from the annual reports of the Inspectors of Fisheries from the Maritime Provinces, as they relate to the increase of salmon in certain localities which come under the influences of artificial culture of salmon.

PROVINCE OF QUEBEC.

Commander Wakeham, officer in charge of the Fisheries Protection Service in the Gulf and River St. Lawrence, in his report for 1881, says:—

"The first fish were of a large run, and the fishermen looked forward to a successful season, but the fishing soon fell off, and the catch of 1881 is the poorest within the memory of the 'oldest inhabitant.'

"We are quite unable to venture an opinion as to the cause of this great decrease in the number of salmon visiting our fresh water bays and rivers during these last three years. That the falling off in the salmon net fishery has been something alarming during the last three years can be shown by the following table, which includes the whole of the Gulf fishery."

He also says in his report of 1882. "That the fishing season was a poor one ; a late spring, stormy and cold, continuous heavy freshets in most of the rivers, in spite of all these drawbacks, the increase in the catch was considerable."

In his report for 1883 he says :—" The salmon fishery on the south shore in the Counties of *Gaspé* and *Bonaventure*, shows a considerable increase over last year, the gain being upwards of one hundred thousand (100,000) pounds. On the north shore in the County of Saguenay the fishing was poor."

REMARKS ON THE APPLICATION OF ARTIFICIAL SALMON BREEDING TO THE NORTH AND SOUTH SHORE FISHERIES OF QUEBEC.

It will be noticed from the extracts above quoted from Commander Wakeham's report that, in 1881, the salmon fisheries within his jurisdiction in the north and south shores of the St. Lawrence were *the poorest within the memory of the oldest inhabitant*. At this time and previously, all the rivers within the above mentioned limits must have been supplied with adult fish which were bred in the natural way. But nevertheless from the returns given from the salmon fisheries, they had become reduced very low, in fact *the poorest ever known*. Now this order of things in the almost primitive state of the north shore, could not possibly have been brought about from natural causes alone ; and it would be utter folly to advocate this view of the matter, except from selfish motives. But the true causes have been :—The want of proper protection to assist and maintain nature's operations, especially at the breeding times ; the greed of fishermen, by over fishing ; the unrestricted use of the most deadly engines set everywhere for killing and unduly stopping the fish, on their upward passage to their spawning grounds ; and the destroying of large numbers of little immature salmon in weirs and nets along the coast ; and strange to relate that, notwithstanding this sad experience, these same destructive agencies for the final extermination of the salmon are still going on.

In the Quebec reports are given the aggregate returns only of all the divisions in the north and south shore fisheries of the Gulf. These divisions are made up of twelve sub divisions, namely :—Trinity, Moisie, Mingan, Natashquan, Washeecootai, St. Augustine, Bonne Espérance, Port Daniel, New Richmond and Restigouche. The report gives the catch of 1881 as the poorest in the memory of the oldest inhabitant, and that the falling off was somewhat alarming. The report of 1882 says : The increase in the catch was considerable ; and that in 1883 the north shore fishing was poor, but in Gaspé and Bonaventure a considerable increase was shown.

Now, if the sub-divisions and smaller localities in this extensive territory, where the operations of artificial fish breeding are known to have been applied, are re-examined closely—the Saguenay River on the north shore, and the Gaspé and Restigouche sub-divisions on the Bay des Chaleurs—a very large increase in the catch of salmon in these localities will be found recorded in these same reports. But unfortunately the general falling off in all the divisions where artificial culture has not been applied almost overwhelms in the aggregate returns of the whole twelve divisions the unmistakable increase so clearly shown to have taken place in the three sub-divisions where the rivers have been stocked with fry from the hatcheries. In a comparison it is found that in the whole twelve divisions, from 1881 to 1883 inclusive, some 3½ per cent. decrease is shown ; whereas in the three sub-divisions when taken alone—the Saguenay River section shows an increase of 115 per cent. from 1881 to 1883, the Gaspé sub-division 211 per cent. from 1881 to 1883, and the Restigouche sub-division 108½ per cent. increase is shown to have taken place in the same period.

Now it may be fairly asked, how is it that such a wonderful difference should appear in the catch of salmon in these localities ? The question will be best answered by relating the following facts :—In 1875 the first small lot of 60,000 artificially bred fry were turned out from the Tadoussac Hatchery into the tributary branches of the Saguenay River. In 1876 another lot of 150,000, and in 1877 a larger supply of a million and upwards, were distributed in like manner in the Saguenay waters ; and this work has been going on regularly ever since. But no young fish have been put

into the rivers (lower down the St. Lawrence) which form the north shore fishery divisions of the Gulf. Again, in 1874 and 1875, the salmon hatching establishments at Gaspé Basin on the Restigouche River commenced planting their first broods of artificially bred fry in the waters of the Gaspé and Restigouche sub-divisions on the Baie des Chaleur. These supplies were small at first, but they grew larger afterwards, and the same system has been continued up to the present time.

From these facts then, it may be claimed justly that the stocking of the waters of the Saguenay, Gaspé and Restigouche Rivers, with artificially bred fry from the above named hatcheries, may (to say the least in their favour) have been the principal agencies in bringing about these greatly increased percentages in the catch of salmon in the fisheries of these sub-divisions, and more especially so, when it is also shown that the decrease in the other sub-divisions where fry had not been planted, although small, was very remarkable.

Another very pertinent question will no doubt be asked, namely: How is it that by planting young salmon in certain rivers in 1874-75 and 1876, they can now be brought in evidence for the increased catches of salmon in the fishery stations referred to? This question may properly be put by persons unacquainted with the nature, habits and growth of the salmon; as the history and the peculiar habits of this fish, with the large masses of the community, and especially with the fishermen (whose principal aim is only to kill them), is but little known, and the latter class are less liable to become converts to the real facts than others, on account of the old traditional ideas and tales which have been handed down from father to son, concerning these fish. For instance, it is held by some of these fishermen that the salmon, after laying their eggs up stream, take back with them their broods of young fish to the sea, to return again the following year as full grown salmon; others claim that only two and three years are requisite for salmon to arrive at maturity. But when told that six, seven, eight and nine years, actually pass before they become adult fish, the statement is disbelieved and held to be a fallacy, not only by the fishermen but by many others of the more incredulous class of persons.

The growth of the salmon from the egg to full maturity is now pretty well established from experiments made in the United States, Ireland, Australia and elsewhere, to take from six to eight years, and in some instances even longer periods of time, depending largely upon the capacity of their native streams to furnish supplies of food for their earlier growth to the stage of smolts, at which time they pass down to the sea, where, again depending upon the abundance in their feeding grounds, they remain a longer or shorter period, till they ripen into full maturity, when by an instinctive demand of nature they migrate to their native streams again to reproduce their species. After performing this necessary requirement they retrace their journey to the sea, and annually perform a like round, till death follows from natural or other causes. Young male salmon, however, called "grilse," will (in many instances) return to their native rivers, as a rule, a year or so earlier than the females of the same brood, from the fact of the earlier development of their reproductive organs.

In this way then, it is answered, why the planting of artificially bred fry in certain waters in 1875, 76 and 77 might reasonably show a return of grilse and salmon in the same waters, in about five, six or seven years afterwards, namely, in 1881, 82, 83 and following years. One or two well known examples in proof of these statements are here given, which will suffice for the present:—"For upwards of half a century the Connecticut River, United States, was exterminated of salmon; in 1869 a lot of two thousand (2,000) artificially bred fry were put in the river; a second lot of thirty (30,000) was put in during 1870; in 1873 another lot of one hundred and fifty thousand (150,000) was added; in 1874 a much larger number was added, making a total during four years of about two millions (2,000,000) of young salmon that were planted in that river by the Fishery Commissioners of the State of Connecticut. In 1874 and 1875 the first successes were noticed in seeing and catching some young salmon in the vicinity of the place where the young fry were first planted; in 1876 three salmon were caught in the nets, and doubtless more were

taken; a dozen and more were taken in 1877; but in 1878 the salmon came into the river in large numbers; and by the end of the season five hundred (500) and upwards had been known to be caught in the nets; some of these weighed fifteen and twenty pounds." "Great incredulity had been manifested by most persons as to any practical results from artificial propagation, and, as year after year passed without bringing the expected run of salmon into the Connecticut, sneers and jokes, at the expense of the United States and State Commissioners, multiplied. The occurrence, however, of one or two large salmon in the Connecticut in 1876, a dozen or so in 1877, interfered with this scepticism, which was changed into enthusiastic appreciation by the appearance in 1878 of large numbers of fine fat salmon."

No better proof of the efficacy of artificial fish-breeding, as applied to the restocking of a depleted river with salmon, could well be given. For here we find a large river wholly barren of these fish for upwards of half a century again replenished with grilse and salmon after only a few years planting of artificially bred fry.

Salmon were not indigenous to the Delaware or Susquehanna Rivers. Artificially bred salmon fry were put in them in 1871, and following years. In 1879, Professor Baird writes thus:—"The results of the experiments of introducing salmon into the waters of the United States, are just beginning to appear, over five hundred (500) having been taken in the Connecticut, and large numbers were known to have passed up river. About twenty mature salmon have been captured in the Delaware. One of these weighing twenty three and a-half pounds, I have in my possession, I think there is little doubt that these are derived from eggs that Thaddeus Norris got from you (Mr. Wilmot) somewhere about 1871. I have also a nineteen pound one from the Susquehanna, but so far no Quinnat salmon have shown themselves. I hope to see some of them next year."

One example only will be given here of the growth of salmon in the waters of our own country, but numerous applications of the subject will be found throughout the whole of these remarks. In 1877-78 artificially bred fry were put in the upper waters of the La have River in Nova Scotia; on account of several impassable mill-dams at the mouth of this river, salmon had not passed up it for several years. In 1882, some small sized salmon (grilse) were caught below these dams. In 1883 many larger ones were captured. In 1884 upwards of 500 adult salmon were taken during the early fishing season in the neighbourhood of these dams. From this and the former examples many more of which might be given, it is pretty clearly shown what length of time is taken by salmon to become grilse and when they arrive at maturity.

NOVA SCOTIA.

Mr. Venning, Inspector of Fisheries for New Brunswick, in his report for 1881, says:—

"The serious decrease in the catch of salmon recorded in my last annual report has, I regret to say, been still more marked during the present year. The salmon fisheries of this Province have fallen more than fifty per cent. below the catch of former years. In all our rivers and estuaries the number of nets is excessive, and for years this fishery has been pursued beyond the power of the fish to multiply, and I can only again express my strengthened conviction that, as long as this excessive fishing continues to be pursued, no permanent improvement can be expected."

Mr. Venning reports again in 1882 as follows:—

"There has been an important increase in the catch of this fish (salmon) as compared with that of 1880 and 1881, but it falls very far short of the catch in 1879, 1878, and 1877. I see no reason, from this increase, to change the opinion I have so often put on record, that the salmon fishery of this Province has of late years been pursued to so excessive an extent, that the power of the fish to multiply cannot keep up the stock against so great an annual drain. It must be borne in mind that, the number and extent of nets now in use in New Brunswick and the number of men now engaged in this fishery, far exceeds those of former years, when much larger

catches were made. It should also be remembered that greatly improved modes of arranging and setting these nets has, of late years been developed by the ingenuity of fishermen, stimulated by the enhanced price obtained for their fish. But with all these additional nets, and with all these improvements in setting them, the combined catches of the last three years aggregate less by three hundred and thirty-six thousand and six hundred and eighteen (336,618) pounds than the single catch of the year 1873 and less by seven hundred and eighteen thousand, two hundred and seventy-eight (718,278) pounds than of 1874. In the face of truths like these it is useless to deny that our salmon fisheries are threatened with exhaustion if the present over-fishing is not curtailed, and it is worse than folly to expect any permanent improvement as long as this excessive fishing is pursued."

Mr. Venning again reports in 1883 on the salmon fisheries of New Brunswick thus:—

"The improvement in the catch of this fish, reported last year, has not been maintained. The returns show a decrease of 2,815,76 pounds as compared with those of last year (in the whole Province). Though the catch was slightly better than in 1881. * * * The only county in the Province which shows an increased catch is Restigouche."

Overseer Verge, of the Upper Division of the Restigouche, reports an increased catch of salmon. The figures show 78,660 pounds, against 55,183 pounds last year.

Overseer McPherson, of the Coast Division (Restigouche), also reports a better year for salmon. The returns show a catch of 128,200 pounds—an increase of 38,792 pounds over that of last year, of 1882.

Warden Phillips, of Canaan River (Queen's County), reports that quite a nice run of salmon ascended that stream. * * For several years in succession quotas of young salmon from the Miramichi hatching house were placed in this river and also in Salmon River, emptying into Grand Lake. Had any of these attained maturity they should now begin to show themselves. Those seen may be some of them.

NOVA SCOTIA.

Inspector Rogers, in his report of 1881, on the salmon fisheries in Nova Scotia, says: "The salmon fishery still continues to decrease. * * * In this Province these fish seem to have for the time abandoned our unobstructed eastern rivers, as well as those afflicted with mill-dams and sawdust, in the central portions of the Province. I confidently look for a return of these fish at an early date, in abundance, and we are not without encouraging facts of this, for during the past fall the rivers were well stocked with fish. This fact is noted by many overseers, and *particularly so of the rivers in which young fish were placed the past few years*; so that we may look with confidence for a large increase in this fishery the next and following years."

In Inspector Rogers' report for 1882 he says: "This year gives an increase of 125 per cent. over the preceding one, with an increased average over former years. It is a fact which augurs well for the future, that our rivers were well stocked with fish, particularly those into which Mr. A. B. Wilmot has been planting young salmon for the last five and six years. A continuation of this planting, but upon a much larger scale, with the construction of one of the new fish-ways in each mill-dam, would very soon have the effect of filling our rivers and coast with valuable fish again. To supply so many of our rivers we should have had some ten millions of fry to distribute instead of one million. The rivers of Lunenburg, Queen's, Shelburne and Yarmouth could, with a moderate outlay, be made to produce millions of dollars in wealth to the country in ten or twelve years, by a proper and liberal effort in this direction. Money cannot be spent in this country in any enterprise which will more certainly return a rich reward than in the *artificial culture of salmon* in these localities, and I trust this matter will receive the most earnest consideration."

There were returns from some twenty-five local overseers, fifteen of these having oversight of the fisheries in eight counties where artificially-bred fry have been planted, return increased catches of salmon. Ten of the overseers having charge of counties where no fry have been planted, report decreased catches.

Mr. Rogers reports again, in 1883, as follows: "The catch of salmon during the season was about the same as that of the previous year. This is an increase of over 100 per cent. each year over 1881. Thus showing a very encouraging return, and there is every reason to expect a still larger increase next season, as will be seen by reading the overseers' reports. The rivers and estuaries were well filled with parent fish during the fall months; there are so many of the principal streams opened up by means of the new fish-ways that we may look for very gratifying results, more especially since the results of artificial culture are beginning to give unmistakable evidence of its utility."

"I cannot refrain from again urging upon your attention the great importance of extending, at the earliest possible date, *artificial culture of salmon* to streams in Queen's, Shelburne and Yarmouth counties, where these fish, owing to entering the rivers in March and April, command a dollar a pound and sometimes more. I am quite sure that no expenditure could be made which would render so certain so large or so profitable returns for the outlay."

REMARKS ON THE APPLICATION OF ARTIFICIAL SALMON BREEDING TO FISHERIES OF NEW BRUNSWICK AND NOVA SCOTIA.

In ascertaining whether artificial fish culture has benefitted any of the salmon fisheries in the Provinces of New Brunswick and Nova Scotia, it will be unnecessary to repeat the views relating to the habits and growth of the salmon, as previously explained in connection with the improvements of certain salmon fisheries in Quebec, as the application of the subject in that Province will apply equally the same to New Brunswick and Nova Scotia. It will only be necessary therefore to refer briefly to points directly bearing upon the results of fish culture, as applied to many waters in these Provinces, and take the official returns from the inspectors and other officials, to show in how far these results have been realized.

NEW BRUNSWICK.

It will be noticed in the extract, previously quoted from the annual reports on the salmon fisheries of New Brunswick for 1881: "That the salmon fisheries had fallen more than 50 per cent. below the catch of former years." It will also be seen that certain causes for this decline are very aptly and correctly given by the Inspector. But it is to be regretted that neither from this nor from the other Provinces is any mention made concerning the pernicious effects of sawdust and other mill rubbish in the rivers and streams, which are the nurseries from which the increase or decrease of the salmon fisheries of the several Provinces is to be derived. It would be very difficult indeed to conceive a more direful scourge to the fisheries interests of the country than that produced from the unrestricted casting of sawdust into the waters frequented by salmon, and many other kind of fish, for feeding and breeding purposes. Next to the downright slaughter of the parent salmon at the spawning times, as a direct means of exterminating their race, comes the more slow, yet sure, undermining, noxious and eventually fatal results, from sawdust; especially does its baneful influences effect the haunts of the salmon, and others of the anadromous species, where pure, limpid water is an indispensable requisite for their healthful existence.

The throwing or drifting of all other descriptions of saw mill rubbish into the streams of the country causes but a trifling injury in reality to the salubrity of the water for fish propagating, or artificial fish-feeding purposes, when compared with the noxious influences of sawdust, for wherever it settles, at the bottom of streams or other waters, it kills all animal and vegetable life, and makes putrid the otherwise naturally healthy depositories for laying and hatching fish eggs; and in the end, by constant accumulation in the beds of streams, rivers and bays, causes them to become barren

and unsuitable for fish to frequent; and, furthermore, its injurious influences are now becoming very seriously felt in the blocking up of channels and harbours, which were formerly navigable in many places, but which now have become almost useless for ordinary traffic.

It cannot be considered as inopportune to thus refer briefly to the pernicious effects of sawdust, for when it is known to have caused such destructive results to the increase of salmon by the natural means in many of the rivers and streams of the Maritime Provinces, the same influences will, in a great measure, in a like manner, seriously interfere with the beneficial results that would otherwise be realized from the application of the artificial methods of re-stocking streams. For if a river, or other water, has become so polluted from any cause as to make it unsuitable for the breeding and growing of salmon in the natural way, it must not be expected that the stocking of such a river with artificially-bred fry will accomplish the desired end. But the artificial method will nevertheless have an advantage over the natural means; for by the latter the egg would have to face the difficulties and dangers of some six months or more in the river, until the hatching time arrived; whereas, by the former, the egg would be cared for in the hatching room, away from the difficulties and dangers in the other case, and kept in pure, cleanly water, not affected by the polluted influences referred to from sawdust or other deleterious matter.

To the effects of sawdust and other mill rubbish, impassable mill-dams, deleterious matter of various kinds from manufactories, and the ruthless hand of man in the use of the net and spear upon the spawning grounds (and not so much to excessive, legitimate modes of fishing, which at the present time are no doubt beyond all reason), are mainly to be charged the decadence of the salmon fisheries from former times, in many sections, not only of New Brunswick, but also in the other Provinces of the Dominion; and had it not been for the monopolizing and party influences wrongly exercised by the proprietors and co-workers of these serious impediments to the maintenance of fish wealth in the country, their evil effects could, by wise legislation, have been avoided long ago, without in any way seriously affecting the interests of this same class of persons; whereas, the evil which has been permitted has simply given riches and aggrandizement to a few, whilst the great mass of the people have become the sufferers, and a great and lasting source of public wealth and luxury in the country has become well nigh exhausted, and in many cases irretrievably lost.

Evidently, from the New Brunswick reports, the salmon fisheries in that Province for 1881 were at a very low ebb. It was never held forth at any time that any beneficial results would be realized from the artificial breeding of salmon in the New Brunswick hatcheries before 1882; as a matter of fact, a few young salmon were bred in the Restigouche and Miramichi establishments in 1874; but it was in 1875 and following years, when they really began the work, and even then, only in a moderate way; therefore no "results" could be well expected from them until some seven or eight years had passed, as has been shown in the examples given of the Connecticut, Delaware, and Susquehannah Rivers, in the United States. This view of the case was somewhat prophetically stated in the fish-breeding report to your Department in 1881, where it said:—

"No visible results of any moment, or a run of adult fish of artificial breeding, can be reasonably looked for in the Miramichi, till the season of 1882; this standard of reasoning concerning the Miramichi River applies equally to the Restigouche, as both hatcheries commenced operations about the same time, each meeting with some reverses at the outset, but since 1877 the operations have been more satisfactorily performed." This prediction is fairly verified by the following returns from the New Brunswick and Nova Scotia reports, as given in by the inspectors of these Provinces. The application of this view has already been given when speaking of the Province of Quebec.

The annual report from New Brunswick, for 1882, says:—

"There has been an *important increase* in the catch of this fish (salmon) as compared with that of 1881 and 1880, but it falls very far short of the catches of 1879, 1878 and 1877." * * *

Now as this improvement was expected, and it may be said actually foretold, it will not be out of place to apply a share of this "*important increase in the catch of salmon*," to the operations of the Restigouche and Miramichi hatcheries, and it may be demonstrated in this way:

The salmon fry which were distributed from these nurseries into the Restigouche and Miramichi Rivers, and their many branches, and other streams also, which empty into the Baie des Chaleurs, and along the coast, would, at the time of their maturity (in about seven years), begin to leave their feeding grounds in the sea on their first imigration back to their native streams, and strike to the nearest mainland, along the shores of which they would coast till they found the rivers or streams of their youth; up these they would journey until suitable spawning grounds were found to lay their eggs. Now, if it were not for the nets which are far too numerous set all along the coasts, the supplies of salmon due to each river could be pretty well ascertained, for they would undoubtedly pass by the estuaries and mouths of all other streams, and surely enter their own by the exercise of an unerring instinct. Therefore the large catches of salmon now made in these nets along the shores of the Counties of Restigouche, Gloucester, Northumberland and Kent, would in a large measure be natives of the larger rivers of Restigouche and Miramichi. And in considering the returns of salmon and "*the important increase of these fish*," referred to in the New Brunswick report: The Counties of Restigouche, Gloucester, Northumberland and Kent, fairly represent the New Brunswick fishery districts, in which the results of the operations in artificially breeding young salmon at the Restigouche and Miramichi hatcheries would be known and felt; and this is quite fully exemplified from the fact of these counties showing in their aggregate returns for 1882 an increase of 42 per cent. in the catch of salmon over 1881; whilst, in the other counties of the Province, where no planting of salmon fry had been carried out, a decrease in the salmon catch of 1882 is recorded, except in the outside fisheries of the harbour of St. John.

Reference must necessarily be made here to the astonishing increase in the catch of salmon, as returned from the St. John district, from Point Lepreaux to Quaco Head, which is 434 per cent. over the catch of 1881, or 267,300 pounds in 1882, against 50,000 pounds in 1881. This wonderful increase in figures, if thoroughly correct, goes to show that some extraordinary influences must have been at work to produce such a result; and even although a revision of the figures might somewhat change this return, the subject is worthy of some investigation, in order to exemplify the effects of artificial salmon culture, as applied to nearly the whole of the counties in the Provinces of New Brunswick and Nova Scotia, which border upon the shores of the Bay of Fundy, and the upper estuaries in the Chignecto Bay and Minas Basin.

Whilst this increase is shown in the outside and harbour fisheries of the County of St. John, the inland counties, extending from the harbour to the Grand Falls, and taking in the whole of the salmon fisheries of the St. John River, with its branches, show the poorest catch on record since 1870. The only inference to be drawn from this is, that either the net fishing in the bay and harbour outside was so excessive as to prevent the passage of salmon up river, or that the great majority of fish taken outside in the bay, between Point Lepreaux and Quaco Head, were not salmon, natives of the St. John River, but belonged elsewhere and were captured on their migration from the sea up the Bay of Fundy to their native rivers and streams, which empty into the Chignecto Bay, Minas Channel, Minas Basin and Cobequid Bay.

It will, no doubt, be understood by persons acquainted with the migratory and instinctive habits of the salmon, that, as previously related, these fish, when arrived at maturity and surfeited on their feeding grounds in the ocean, commence their journey shorewards, and strike to the nearest or most convenient mainland, along which they then coast till they find their native streams to enter. By referring to a map of the Maritime Provinces and looking at the principal places where salmon are taken by the fishermen, the course of their migration inwards from the sea, and of their journey along the coast or shore afterwards, will be clearly illustrated,

especially in the Bay des Chaleurs, as shown in the official map of the fishery stations, published along with the Departmental Fisheries Reports for 1878, where it is found that the great runs of salmon coming in from the Gulf take a south-westerly course, striking the southern shore of the Bay des Chaleurs, thence travelling along that shore till they reach their destination in the fluvial waters of the Restigouche River. And still further verified by the sagacity of the fishermen occupying one hundred and seventy-six (176) fishing stations on the south shore, with only fifty two on the north shore.

The salmon fisheries of the Miramichi Bay, and coast, to the north and south of it, will give another illustration of the migratory courses of the salmon from the sea to the mainlands, and thence to their native rivers. Coming in from the Gulf, between the headlands of Shippegan, on the west, and Cape North, on the east, in a south-westerly direction, they strike the shores of the Counties of Gloucester, Northumberland and Kent; when they take their route south and north along the coast, for the rivers of their youth, which in this case would be the Miramichi River and its branches. Taking the courses of the salmon from the Gulf by Cape North, on Prince Edward Island, and Richibucto Harbour, in the County of Kent, New Brunswick, it will be found that from the latter point north to Escuminac, 50,000 pounds of salmon were taken; whilst south of Richibucto, including the river, taking in the greater half of the coast of Kent and the whole of Westmoreland, only 1,160 pounds were returned. And further, the catch of salmon in 1882, from Escuminac north to Shippegan, inclusive of Miramichi Bay (but exclusive of the river fisheries), amounted to 268,481 pounds; the Miramichi River catch was 163,915 pounds, making a total catch of 432,396 pounds; numbering, at ten pounds each, 43,239 salmon over and above those that escaped the nets when striking the mainland between Shippegan and Richibucto (by an instinctive direction) from their feeding ground in the Gulf, or in the Atlantic. Nearly the whole of this great run of salmon would be natives of the Miramichi River, which has been and now is somewhat largely supplied with young salmon propagated in the natural way, and by the artificial methods pursued at the Miramichi hatchery.

Another clearly defined illustration of the landward course taken by the salmon on their migration from the sea, is shown by the "runs" of these fish entering the Straits of Northumberland by the eastern passage. Here again they take a south-westerly line from the Gulf, striking the mainland on the coasts of Antigonish and Pictou, in Nova Scotia; when at Cape George a division of families, so to speak, takes place, some going eastward to their rivers by entering St. George's Bay, others going westward to their rivers along the coasts of Pictou, Colchester and Cumberland Counties; but by far the greater numbers are captured where they first approach the mainland, namely: Pictou County (eastern half), 87,830 pounds; Antigonish, 39,705 pounds; whilst further up the straits, taking in the west half of Pictou and the whole of Colchester and Cumberland Counties, only about 2,000 pounds were returned as taken in 1882. The above illustrations of the direction taken by salmon coming in from the sea show clearly that where the great runs of fish first strike the shores of the mainland the sagacity and uncontrolled greed of the fishermen soon find it out, and there unrestrictedly ply their skill to such an extent as not only to gradually decrease but ultimately exhaust the supplies of salmon due to the rivers near at hand, and those belonging to rivers and streams far away from the points where they first struck upon the coast.

With these illustrations of the courses taken by salmon to reach their native rivers in the Bay des Chaleurs; at Miramichi; and at Pictou; the description to be given of the migrations of these fish up the Bay of Fundy; and into the basins, and rivers at the head of it; will be more readily understood; and may also give some information relative to the cause of the magnitude of the salmon fishery, as pursued inside, and outside the harbour of St. John, when compared with other salmon fisheries, in the Bay of Fundy, which ought, and are fairly entitled, to participate in the benefits derivable from the large "runs" of salmon which annually enter that great arm of the sea; and it may not unwisely be put forth as a reasonable argument in demonstrating the good results to be derived, from the wide spreading usefulness of artificial fish culture.

The Bay of Fundy is the great highway, so to speak, by which all salmon, natives of the rivers and streams which empty into this great arm of the sea, migrate to and from the ocean. The course taken by these fish entering the bay from the sea, would be in a north-easterly direction; passing between Grand Manan Island on the west, and Brier Island on the east; following this course they would strike the mainland on the north side of the bay, between Point Lepreaux and Quaco Head; on this line and between their limits, are the famous salmon fisheries of the Bay of Fundy; well-known as "the outside and inside fisheries of the harbour and County of St. John." Here 267,300 pounds of salmon were taken in 1882, whilst in the other nine counties of New Brunswick, and in five counties of Nova Scotia; whose salmon breeding rivers and streams empty into the waters of the Bay of Fundy, all these put together only show a return of 99,872 pounds. Of this quantity, the incredibly small catch of 19,312 pounds is made up in the six counties, through which the great St. John River, with its multitude of tributary feeders run, and is the lowest record of any year since 1870.

Of the large "runs" of salmon up the Bay of Fundy from the sea, a considerable portion of them undoubtedly belong to waters at the head of the bay, in the streams of the Counties of Albert and Westmoreland, in New Brunswick, and in the streams of the Counties of Cumberland, Colchester, Hants, and King's, in Nova Scotia. The salmon belonging to these counties would, after striking the coast between Point Lepreaux and Quaco Head, if not taken by the drift and stationary nets set in their line of migration, coast eastward and enter Chignecto Bay and Minas Basin, in search of their native streams. In this view of the matter, it is but reasonable to conclude that a certain proportion of the large catch of salmon annually reported as taken from Quaco Head, to Point Lepreaux, in the St. John fishery district, are salmon belonging to the waters of Nova Scotia, and not wholly to the St. John and other rivers of New Brunswick.

In putting forth the statement that the distribution of young salmon, artificially bred at the Bedford hatchery, into certain rivers and streams in Nova Scotia, has been in a large measure the means of bringing about the increased catch of salmon in the St. John fishery district, in New Brunswick, by 400 per cent. in 1882 over 1881, it will be considered by many persons to be as remote from possibility of demonstration, as the distances are apart, from which the evidence will be taken to fully illustrate the subject under consideration.

Now, it must be understood that although a salmon hatchery is running on the St. John River, no results can by any possibility be realized from it before 1886 or 1887, as the institution was built in 1879, and the first brood of fry was turned out from the hatchery in 1880. It must also be understood that the catch of salmon throughout the whole extent of the St. John River has been regularly on the decline for the past ten years, the lowest catch being in 1882. This reduction in the stock of parent fish in the river, where the multiplication in their species is brought about, would necessarily reduce the number of adult salmon returning to the river from the sea up the Bay of Fundy, through the limit of the St. John district fishery, between Quaco Head and Point Lepreaux. But, nevertheless, the returns show a wonderfully large increase in the catch of 1882, within this limit, over that of 1881 and 1880. The fair inference to be drawn from the above is that, a large proportion of this increased catch of salmon, were not natives of the St. John River, but of some other rivers of the Bay of Fundy, where these salmon were migrating to in order to re-produce their species. Now where might their destination have been, and what part can the artificial propagation take in the solution of this problem?

The Bedford salmon hatchery near Halifax, was established in 1875; from which time to the present, large quantities of artificially bred fry have been annually distributed in the streams of most of the counties in Nova Scotia. The Counties of Cumberland, Colchester, Hants, King's and Annapolis; all bordering more or less upon the shores of the Bay of Fundy, receive quotas of salmon fry from the Bedford nursery. The proportion of these that escaped destruction, and grew to the stage of "parrs" and "smolts" would, by the law of nature which guides them, leave these

streams and pass through the Bay of Fundy to the sea ; where, after the proper lapse of time, they would reach maturity, and retrace their way back to the rivers or other streams in which they spent their youth. Thus it will be seen how the planting of artificially-bred salmon fry in the the above named counties of Nova Scotia, would in the natural course of events, benefit and increase the salmon fisheries of the Bay of Fundy, more especially that portion of it which constitutes the St. John fishery district, between Quaco Head and Point Lepreaux ; corroborative evidence of this is further shown in the fact of the above mentioned counties in Nova Scotia having returned increased catches of salmon within their limits in 1882 (amounting to some 40 per cent. increase over the averages of the four previous years), simultaneously with the large catch between Point Lepreaux and Quaco Head. When at the same time, the great tidal river of St. John (with all its affluent branches) which is the generally reputed feeder of the salmon fisheries of the Bay of Fundy, shows a greatly reduced catch of these fish from former years.

Having commented upon the effects of artificial salmon culture in relation to the increased catch of salmon in New Brunswick in 1882, it must be mentioned here that the returns for 1883 do not appear in such a favourable light, as they show a general decrease in the whole Province of some 26 per cent. under 1882 ; but when the Restigouche division of the Bay des Chaleurs is taken by itself, where the benefits from the Restigouche hatchery have been directly applied, a most favourable result is recorded of 45 per cent. increase in 1883 over 1882.

It must also be noted that the salmon fisheries throughout the north and south shores of the bay, which come within the range of the operations of the Restigouche hatchery, namely, in the Counties of Gloucester, Restigouche and Bonaventure, these, collectively, show an average increase in the return of salmon caught in 1883 of 25 per cent. over 1882. It is somewhat remarkable, however, that the returns for the County of Northumberland, where a hatchery is in operation on the Miramichi River, should show a decrease in the catch of 1883 as compared with 1882.

NOVA SCOTIA.

With regard to the operations in artificial salmon culture, as applied to the majority of the counties in this Province, the beneficial effects are made so apparent from the reports of the Inspector of Fisheries, that little further may be said relative to the very satisfactory increase of salmon taken in 1882 and 1883 over 1881 and previous years ; and as these years are the ones in which the first crops of young salmon turned out from the Bedford hatchery would have become sufficiently mature to return to the rivers for spawning purposes, where they were first planted as fry, it is only fair to conclude that the large increase referred to in the annual reports, was in part occasioned by the planting of considerable numbers of salmon fry in many of the rivers of Nova Scotia, from the Bedford nursery, six and seven years before ; and more especially may it be so considered from the fact, that in the ten counties of the Province where artificially-bred fry were planted, the average increase in the catch of salmon in 1882-83 amounted to 138 per cent. over 1881 and previous years ; when, in the other counties of the Province where fry had not been planted, the increase during the same period was only 43 per cent. ; and in selecting some individual counties, where more liberal supplies of young fish were distributed at first, namely, Halifax County, an increase of upwards of 200 per cent. is shown over former years.

MAP EXPLANATORY OF THE APPLICATION OF ARTIFICIAL SALMON CULTURE IN THE MARITIME PROVINCES.

The accompanying map or chart of the salmon fisheries of the Maritime Provinces is submitted as illustrative of the migratory courses taken by salmon to reach their native rivers for spawning purposes. The more special object of the

NOTE.

Figures in Red show quantity of Salmon in Pounds.

Figures in Blue show the number of Salmon at 10 lbs. each.

Dotted Lines in Blue show Migratory courses of Salmon to their Native Rivers.

● Denote position of Hatcheries built 1875-6.

○ do do do do 1880-1.

● Districts stocked with Fry in '74-5-6 show an average increase in '82-3 over '81 of 63% p.c.

○ do not stocked as above show within the same periods an increase of 22 p.c.

QUANTITY OF SALMON, 1882.

North Shore, Quebec to Belle Isle,	315,464

MAP
EXPLANATORY OF ARTIFICIAL
FISH BREEDING
 as applied to the Salmon Fisheries of the
MARITIME PROVINCES
FOR 1882
 accompanying Mr Wilmot's report
OF 1884

map is to portray the coast line of the Provinces on the Atlantic and in the Gulf of St. Lawrence, and bays, straits and rivers which salmon are known to pass or enter on their annual rounds to multiply their species. It is of importance that it should accompany the report on fish-breeding operations, more especially to give ocular demonstration of the remarks contained in the report on the "practical application and results of artificial fish-breeding on the salmon fisheries of the Maritime Provinces." On the chart is delineated every salmon fishery district in the Provinces; with the quantities of salmon taken in each, and the numbers of the same (at 10 lbs. each) caught within certain limits. The information obtained, and depicted on the chart, has been collected from the official returns of the Fisheries Department for 1881, 1882 and 1883. The exhibit of the salmon catch on this chart gives the numerical distribution of these fish in the several salmon fishery districts between Quebec and the Straits of Belle Isle, on the north shore, and Quebec and Gaspé on the south shore, also from Gaspé following the coast and bays of New Brunswick, Cape Breton, Nova Scotia and the fisheries of the Bay of Fundy, as recorded in the following table:—

QUANTITIES OF SALMON, 1882.

	Lbs.
North shore, Quebec to Belle Isle.....	315,454
South shore, Point Levis to Gaspé.....	60,933
Anticosti Island.....	8,600
Gaspé to Straits of Canso.....	1,047,380
Prince Edward Island	9,666
Cape Breton Island.....	106,955
Straits of Canso to Yarmouth, N.S.....	317,201
Bay of Fundy, N.B. and N.S.....	367,542
Total.....	2,233,740

The chart also gives the location of the several fish hatcheries built in 1874-75-76, with note marks showing the fishery districts in which salmon fry were planted in those years, and the increased catch of salmon returned in those divisions over the quantities taken in the divisions where young salmon were not planted.

INTERNATIONAL AWARDS AND GOLD MEDALS FOR CANADIAN FISH-BREEDING.

At the great International Fisheries Exhibition, London, 1883, the Dominion of Canada made a large and at the same time most satisfactory exhibition of fish and fishery products, and also fishery gear and appliances of every description generally in use in Canadian waters. Practical fish culture, with working sections, models and apparatus of various descriptions connected with the Canadian method of propagating fish by artificial means, were also shown and obtained awards of the highest character, for superiority in design and for practical work, exemplified in the hatching and growing of salmon during the whole of the six months in which the great exposition was open.

Some fifty thousand (50,000) salmon eggs, of the "salmo-salar" species, were taken across the Atlantic in April, 1883. They arrived safely in London, and certain numbers of them were hatched daily during the months of May and June, in the fish-breeding works erected in the Canadian Court. A number of these young salmon were planted in rivers in England, and the balance on hand at the closing of the exhibition, which had become parrs, of four, five and six inches in length, and of perfect development, were presented to the authorities of the British Museum, in whose aquaria at South Kensington they were placed, where many of them are still

on exhibition. This successful result in fish-hatching, by the Canadian system, was unique, surpassing all other competitors, and obtaining the highest possible award, of the gold medal, for "the best and most complete fish-breeding establishment at the exhibition;" and a gold medal and diploma was also awarded to Canada for the hatching and growing of young salmon continuously during the whole period in which the exhibition was open.

The description of apparatus exhibited in the Canadian Court consisted of a full-size working section of the machinery and appliances in use at the Newcastle establishment in Ontario; also, a working model of this hatchery in full operation, illustrating the complete machinery in use, and the *modus operandi* of the system adopted in all the fish-breeding institutions in Canada. The glass automatic white-fish incubators were also in practical use, during the exhibition. A perfect plaster caste model of the Tadoussac establishment on the Saguenay River, in the Province of Quebec, was shown, giving the position of the salt-water pond, and the practicability of using tidal salt water, for retaining parent salmon through the summer months, and until spawning time.

Some of the breeding works, models and other fish-breeding apparatus which were so successful in practically illustrating Canadian fish culture, and in receiving the highest awards at the great International Fisheries Exhibition in England, were brought back to Canada, and are now on view at the Fisheries Museum in Ottawa.

The generally admitted excellence of the Canadian fish-breeding exhibit in London, for its comprehensive system of arrangement, and absence of all complication in its practical adaptation for hatching eggs and rearing fry, and having obtained the highest award against all competitors, gives sanction to the belief that the science of artificial fish-culture in Canada holds no secondary position with any other country in the world.

The following is a list of awards and diplomas obtained at the great International Fisheries Exhibition, London, 1883, by Canada, for exhibits connected with artificial fish-breeding, namely:—

Jury No. 20, Section 1.

Dominion of Canada.—Wilmot's system: Best and most complete fish-breeding establishment in the Exhibition. Gold Medal and Diploma.

Dominion of Canada.—Wilmot's method: Young salmon hatched out from eggs brought from Canada and grown to the state of "parrs" from 4 to 6 inches long, in the breeding troughs during the time of the exhibition. Gold Medal and Diploma.

Dominion of Canada.—Model of salt-water pond as used in Canada, for retaining parent salmon from June till ripe for spawning. Silver Medal and Diploma.

Dominion of Canada.—Wilmot's system. Working model of fish-breeding establishment as used in Canada. Silver Medal and Diploma.

Dominion of Canada.—Live fish and egg carriers. Bronze Medal and Diploma.

The within report of proceedings connected with artificial fish-breeding in the Dominion of Canada is respectfully submitted.

SAML. WILMOT,

Superintendent of Fish Culture for Canada.

NEWCASTLE, 31st December, 1884.

REPORTS FROM THE SEVERAL OFFICERS IN CHARGE OF FISH-BREEDING ESTABLISHMENTS IN CANADA, 1884.

1.—FRASER RIVER FISH HATCHERY.

The Honourable A. W. McLelan,
Minister of Marine and Fisheries, Ottawa.

SIR,—I have the honour to lay before you my report of operations at the Fraser River fish hatchery in this Province, and beg leave to draw your attention to paragraph (32) in the late Inspector of Fisheries' report for 1883.

In pursuance of that officer's order, I started on the 2nd of October, 1883, in company with the Hon. Senator McInnes, the late Inspector of Fisheries, Mr. Anderson and Captain Pittendreigh, fishery officer, for the purpose of inspecting Pitt River and its tributaries. After examining several localities and making enquiries as to the different classes of fish and their habits, and taking into consideration its isolated position, I did not deem it advisable to recommend the hatchery being placed in that locality.

I afterwards visited several other places on the Lower Fraser, reports of which were sent to the late inspector, which reports, I trust, came under your notice.

The view I had in choosing the present site was that it had been recommended to me by Mr. S. Haigh as being invariably clear and free from sediment during the hatching season; also of an even temperature.

On visiting the place I found a good, large stream of pure, limpid water, in which were a good number of Coho salmon depositing ova. Mr. Haigh also offered a free grant of the necessary land for the erection of buildings. Two acres of this land were procured and held by deed. I concluded that where the salmon selected a natural spawning ground must evidently be suitable for artificial propagation.

On the 5th of March I commenced clearing a site, excavating pond, building dam, clearing ground and making road from the river's bank back to the supply dams. This involved much hard work, as the wood was heavy and the ground hard to clear, thus making the road an expensive one. It had to be bridged for 500 yards over marshy ground, which was impassable for a team of any kind. The foundation had to be hauled and laid in place by hand, and 60,000 superficial feet of cedar had to be split and carried from the woods for covering.

The dam is constructed with large logs, built in the form of a crib-work, 16 feet broad in the bottom, and rising to the height of 9 feet, 1 foot slant being allowed to each foot of height. The bottom log is imbedded 2 feet in the gravel, an apron of 2½-inch plank, of sufficient length, being laid on the face or sloping side of the crib. The lower end of the plank is sunk 2 feet below the bottom log; the crib was then filled in with earth and stone, making the structure staunch and tight.

The dam is 150 feet in length, and the pond in places shows a depth of 8 feet, thus giving an abundant supply of water for the hatching house.

The building is sufficiently high to be clear of any floods that may occur on the Fraser. It stands 30 feet above the level of the river. Its dimensions are 110 x 40, and it is two stories high. It stands near the centre of the two-acre plot. The lower flat is fitted with seventy-one (71) hatching troughs, 35 feet long, 10 inches wide, and 6 deep. These are capable of holding one thousand (1,000) hatching trays, which will hold about three millions (3,000,000) quinnat or five millions five hundred thousand (5,500,000) sucker eggs. By doubling the trays in the troughs double the number of ova can be laid in. Part of the second storey (40 x 40) is fitted up as a mess house and caretaker's dwelling. The remaining part (70 x 40) is used as a store room, but could be fitted up with troughs and tanks at short notice into a commodious hatching room, as I have taken precautions to have the water conveyed from the dam by a flume of sufficient size and elevation as to warrant an adequate supply for both flats. The water flows into a retaining tank, 5 feet above the level of the upper flat, and is led from thence into a large filter tank, and then

taken into the reservoir tank in the house, below where it supplies the hatching troughs.

Capturing Fish.

On the 28th of June I set men to work fishing for quinnat salmon. They captured ten the first day. These were put in cribs and kept in the main Fraser River; I kept the men fishing until the 15th of July, taking one hundred and thirty-seven (137) fish, fifty-three (53) of which died before they could be conveyed to the pond. The balance were put in the pond, and kept there until the 25th of July, when they were liberated. During this time twenty-nine (29) died with fungus. The growth commenced generally where the mesh of the net had marked them, and continued to spread over the body until it reached the eyes and gills, resulting in their death about two days after the gills became affected. Those in the cribs also became affected after being in them a few days. I then constructed a very large open crib, made of sawn slabs, 1 inch thick and 2 inches wide; this I put in the Coquitland River, where water was clear and cool. Here I intended keeping a large supply of parent fish, but fungus attacked them there, and I abandoned the idea of taking any more fish until later in the season.

On the 8th of September I sent a man to the Harrison River, to examine and report upon the different places and advancement of the fish in that locality, as I could not depend upon the reports of the Indians, who were unacquainted with their spawning habits.

On the 15th September I received word from the Harrison River that fish had begun to deposit ova. Accordingly, I made ready the necessary equipments for capturing and caring for them. I arrived at the Harrison on the 20th of September, and commenced taking fish on the 23rd, continuing until the 24th of October, capturing about two thousand (2,000) "quinnat" and three hundred and fifty (350) "suckeyes." From the last mentioned, we took about two hundred and fifty thousand (250,000) ova, and then gave our attention to the "quinnat" salmon, as they are of superior quality, entering the river earlier and continuing to run later in the season.

Of the two thousand (2,000) "quinnat" salmon taken, there were about equal proportions of males and females. As many of the females had been spent before their capture, the actual number that supplied ova was about seven hundred and sixty-five (765). These gave an average of four thousand (4,000) eggs each.

All fish, with few exceptions, were returned to the river after being stripped, and were as full of vitality as any I have noticed in the eastern rivers after going through the same course.

At the request of the Inspector of Fisheries, and for our own convenience, we marked many of the fish by putting a hole through the adipose dorsal fin with a leather punch. Our intention was to fasten a tag to them with the date marked on it, but we were unable to procure the required material before the close of the season.

The men caught some of the fish that had been stripped and let go; they were readily recognized by the hole in the fin. The muscles of the abdomen had fully contracted, and the fish looked natural and symmetrical.

I noticed some fungus in the gills of some the "quinnat" salmon on the Harrison, originating, I have no doubt, from a bruise caused by the fisherman's net while ascending the river.

About the 15th of October the "coho" salmon made their appearance in the Harrison River. They were bright in color, and in good condition for food, although some of them were dying. No fungus could be noticed on them, but they all appeared to be slightly swollen. The Indians used them for food shortly after they died, and the fish appeared to be perfectly healthy.

Ten miles from the mouth of the Harrison River, at the right side of the entrance to the lake, is a hot spring. I will here quote a paragraph from the *British Columbian*, dated the 2nd of August, 1884: "The spring has a temperature of one hundred and

sixty-four (164) degrees Fahrenheit. The water contains sulphuretted hydrogen in large quantities, and an analysis lately made by Mr. W. J. Wenzel, Ph.G., M.D., professor of chemistry in California College of Pharmacy, gives the following: Sulphate of sodium, sulphate of calcium, sulphate of magnesium, chloride of codinium, chloride of potassium, alumina silica. In his report Professor Wenzel says: 'The total amount of solids contained in an Imperial wine gallon equals $89\frac{1}{2}$ grains. The character of the water is that of a mild aperient, the sulphate being by far in the larger proportions.'

The Indians in that neighbourhood informed me that other hot springs, in different localities on the Harrison, are constantly boiling up from the river bed, and the question might be asked, Will the fish run into these warm currents when entering the river? If so, what would be the effects produced?

The ova were placed in cases of fifty thousand (50,000) each, after having been packed in zinc trays with cotton and moss gathered from the trees. They were then conveyed to the hatchery by canoe and steamer. The transit was about ten hours. The ova looked well after being laid down, and the loss was comparatively small on account of the journey.

Shortly after laying in the first shipment a heavy rain caused the water to be muddy and we had to wash the eggs to keep them clean. Before all the supply of eggs was laid in, and before I was aware of the fact, some of the embryos began to develop, and in thirty days after the first shipment of eggs was laid in the trays, the eyes of the fish were clearly discernable. At this period we had lost a considerable number of eggs, as is shown in my weekly reports to your Department. The apparatus employed in hatching salmon must necessarily vary with the species, temperature, and character of the water in which they are hatched. In most of the eastern Provinces perforated zinc, or tin is used for trays; on the McCloud, wire baskets are in use, in which are put twenty-five thousand (25,000) ova to a basket of $2 \times 1 \times 6$. These are found very effectual in practice.

By doubling the supply of water, and causing an undercurrent in the troughs, and shifting some of the eggs from zinc to wire trays, I found it improved them. The eggs of the "quinnat" salmon are much larger than those of the eastern salmon, or any of the other species on this coast. The time of incubation is short, owing to the high temperature of the water, and a much larger supply of aerated water is required than in the eastern hatcheries.

In regard to capturing parent fish in the future, I have the honour to suggest that a retaining pond be made near the salt water, and the fish kept in it until they mature; as this, in all probability, will prevent an attack of fungus; otherwise I would suggest taking them on the Harrison River, as was done this season. I think the attempt to keep fresh run fish in confinement in the muddy water of the Fraser River will always prove a failure. In conclusion, I beg leave to state that all the eggs placed in the wire baskets are in a very healthy state, and that there are now about two thousand (2,000) young fish out. There will be no distribution of young fish before January or February.

I have the honour to be, Sir,

Your obedient servant,

THOS. MOWAT,

Officer in Charge of Fraser River Hatchery.

2.—SYDNEY FISH HATCHERY.

CAPE BRETON, 31st December, 1884.

The Honourable A. W. McLELAN,
Minister of Marine and Fisheries, Ottawa.

SIR,—I beg herewith to submit the following report of the work done in the Sydney hatchery during the past year.

Of the one million and fifty thousand (1,050,000) ova laid down in this hatchery in the fall of 1883, eight hundred and fifty-eight thousand (858,000) young fry were hatched and successfully distributed as follows, viz. :—

	Fry.
Sydney River, Cape Breton County	250,000
Salmon do do	100,000
Margaree do do	150,000
Middle do Victoria County	50,000
Ball's Creek, Cape Breton County	100,000
Trout Brook do	50,000
Black do do	50,000
Clerk's do do	45,000
Big do Richmond County	30,000
Hatchery Brook, Cape Breton County	28,000
Total	<u>853,000</u>

This year I secured three hundred and twenty (320) parent salmon from the different rivers, as follows, viz. :—

Where Caught.	Males.	Females.	Total.	No. of Ova.
Margaree River	117	93	210	447,000
Middle River	7	28	35	170,000
Sydney River	16	40	56	284,000
Ball's Creek		3	3	
Salmon River	5	11	16	30,000
Total	145	175	320	931,000

From the above table you will see that there are nine hundred and thirty-one thousand (931,000) eggs laid down in the hatchery this fall.

The catch at the Sydney River was smaller than usual, owing to the dryness of the season, only one freshet occurring during the whole fall, after which the greater number of fish were captured.

The hatchery being in the same good working order that it was in when first started, required no improvements this year, except the usual painting and fixing up for the new stock of ova. However, some improvements about the grounds were made, the heavy freshets of the spring having carried away part of the mill-dam and the stone breast work around the building, I found it necessary to repair the breast work; and, fearing that the dam would not be properly repaired, I gave Mr. Dobson all the assistance I could, besides bearing part of the expense. I also constructed a fish pond at Margaree River, for the reception of parent fish till ready to spawn, there being so many fish caught there that the tanks were not large enough, and the fish did not seem to thrive well in them.

This hatchery has not been long enough in operation here to show any beneficial results; but I may state that the different rivers which are being stocked show a decided increase of young fish. This I learn from personal observations, as well as from the reports of those parties living in the immediate vicinity of the rivers.

Young fry are to-day quite plenty in the hatchery brook, a place in which a salmon was never known to enter or spawn till stocked by the hatchery. The largest seen being from 4 to 7 inches in length.

I have the honour to be, Sir,

Your obedient servant,

C. A. FARQUHARSON,

Office-in-Charge.

3.—BEDFORD BASIN HATCHERY.

BEDFORD, 31st December, 1884.

The Honourable A. W. McLELAN,

Minister of Marine and Fisheries, Ottawa.

SIR,—I beg to submit the following statement of the operations at this hatchery during the past year.

The total number of eggs laid down last autumn was one million five hundred thousand (1,500,000), from which were hatched this spring about one million fry. These were distributed, as per instructions from the Department, in the following named rivers:—

		Fry.
Musquodoboit River,	Halifax County	80,000
Sackville	do do	40,000
Big Salmon	do do	40,000
Little Salmon	do do	40,000
Nine Mile	do do	40,000
Indian	do Hants County	40,000
Meander	do do	40,000
Hebert	do King's County	40,000
Gaspereau	do do	40,000
Cornwallis	do do	40,000
Philip	do Cumberland County.....	80,000
Wallace	do do	40,000
Salmon	do Colchester County	40,000
Stewiacke	do do	40,000
North	do do	20,000
East	do Pictou County	60,000
Middle	do do	60,000
West	do do	80,000
Annapolis	do Annapolis County	40,000
La Have	do Lunenburg County.....	20,000
East	do do	40,000
Tusket	do Yarmouth County	40,000
Total.....		<u>1,000,000</u>

These were all safely delivered in a good, healthy condition, no loss being met with, except among one lot of sixty thousand (60,000) fry intended for the Gold, Martins, and Mushamush Rivers of Lunenburg county, which became weak and sickly on the long journey, and in order to prevent a total loss they were put in the East River of that county as above.

Collection of Ova this Season.

The collection of ova for this season's hatching has been attended with very poor success. Salmon were reported as plentiful during the months of August and September in the harbours and rivers, but the continued drought and consequently low stage of water in October and November prevented their entering the fresh water, or ascending to the points where the spawning sheds and tanks are located. West River being the only stream in which fish are taken in the tidal waters, returned the greatest number of spawners. River Philip, where salmon were reported as unusually plentiful in the tide-way, but where the fishing station is about one and a-half miles above tide, returned almost nothing, the low stage of the water preventing the fish from entering. The Liverpool River, in Queen's County, where an effort was made to catch some salmon, also returned nothing. On Sole's Brook, or Chezzetcook River, where I built a small tank and engaged a crew of fishermen, very few fish were taken. A peculiarity of the catch this season was the small proportion of male fish. This no doubt was due to the high stage of water during the months of July and August, which permitted these fish to enter the rivers at that time, long before fishing commenced. The total catch was as follows: West River, 64; Philip River, 16; Sole's Brook, 12, being 92 in all, of which 17 were males and 75 females, yielding eight hundred thousand (800,000) ova, which is the extent of the stock received this season.

I regret the poor success of this work this year, and it is a great disappointment, as I made every preparation necessary for securing a large catch, but the season was decidedly unfavourable. The fact is, hundreds of spawning salmon never entered the fresh water, but deposited their ova on the gravelly shores of the coves and bays. The ova so deposited will no doubt be almost entirely lost, but this will be counter-balanced by the large numbers of eggs deposited at the extreme head-waters of our rivers by a run of salmon which entered in July and August.

From every quarter I hear of quantities of salmon having entered the rivers this summer, greatly in excess of any for the past ten years, and I have no doubt whatever but this increase is largely due to the operations at this hatchery, but I find it almost impossible to obtain any positive information from the fishermen, as they, being prejudiced, are unwilling to admit that this increase is due to any artificial efforts on the part of the Department. As far as I can learn, a great increase was observed in River Philip, where fully four hundred (400) salmon were taken during the summer and fall fishing. One man alone admitted catching over sixty, while many others were quite as successful. I am informed by a thoroughly reliable party that the numbers of salmon entering the Musquodoboit River was greatly in excess of that of any year for the past ten years; and, in fact, the same can be said of almost all the rivers. One instance of a most marked increase offers itself in the La Have River, where the average catch per year, for the past ten years, has not exceeded twelve fish, while that of 1883 was two hundred, and, for the past year, five hundred salmon.

This increase has taken place in spite of the existence of five or six almost impassable dams on the river, and cannot be claimed as due to the natural reproduction of the salmon themselves. I commenced stocking this river at its extreme head waters in 1878, and each year since it has received from ten thousand to twenty thousand fry. A most convincing feature of this increase in favour of its being due wholly to the numbers of young fry placed there, is the fact acknowledged and commented upon by the fishermen in the vicinity, that while the number of salmon has so wonderfully increased, the size of the fish is not equal to that of former years. This, without doubt, is due to the presence of young and half-grown salmon. The first fry placed there in 1878, would, in 1882, be only four years old, and, of course, small in size, while those of 1879 were last season in the same condition as to size. Now, the fact that a most decided increase of salmon of a small size was observed in that river at the precise period when a return would be expected from the planting of 1878, should be sufficient to convince the most skeptical that fish-breeding has

shown its good effects there, if no such convincing evidence has been obtained elsewhere. I have just reason to believe that equally as favourable reports could be obtained in other rivers, if means were adopted to that end, but, as stated above, the men who possess the information we seek, refuse to give it, fearing to commit themselves by acknowledging their violation of the law by fishing after the "close season."

Wallace River, in Cumberland County, is well adapted to the growth of salmon, but it has been almost ruined by some dams across its mouth, notwithstanding which, a very large increase has taken place from the numbers of fry placed there each season.

In endeavouring to show that the increase of salmon is due in a measure to the efforts put forth in the way of artificial fish culture, I am aware I conflict with the opinion which the Inspector entertains, that his ladders have been instrumental in bringing it about, but unfortunately, the patent "Roger's ladder" has not been in use long enough to have produced the good results he claims, and further, the increase has taken place in rivers where none of these ladders have been built.

Some years ago I took occasion to draw the attention of the Department to the filthy condition of some of our rivers and their present unsuitability for the growth or production of large numbers of young salmon, and pointed out that, with this unfavourable feature working against us, our progress towards re-stocking would necessarily be slow, if not doubtful. Filled, as our streams are, with large accumulations of decaying sawdust and other mill rubbish, throwing off noxious and poisonous gases destroying every vestige of animal and vegetable life which nature intended as food for the young salmon and other fish, we are handicapped from the beginning. It was hoped that some means would be adopted by which this evil would, at least in a measure, be removed, but it is found that matters are growing worse, and that no effort is now made to prevent mill owners from allowing all their refuse to run into the rivers. The general opinion is that sawdust is the greatest evil we have to contend against, and more attention should be paid to that than the comparatively lesser evils of obstructions and dams. By this it must not be construed as insinuating that ladders are not necessary in many cases, but as contending that the pollution of our rivers, by decaying sawdust, has done more to depopulate our rivers than all the mill-dams yet constructed, and if any improvement is desired the removal of these two evils should be carried on together. What is to be gained by admitting salmon or planting young fry in a river where the very element in which they live is made noxious by the introduction of a poisonous substance? The public are being firmly convinced that all our efforts in the direction of re-stocking our rivers by artificial or natural means will be rendered futile, unless the sawdust clauses of the Fisheries Act are rigidly enforced.

No doubt there exists a difficulty in reference to the enforcement of this clause, arising out of the alleged heavy expense it might entail upon the mill-owners, but it cannot be said that these few parties have any right to use the waters of our rivers in such a way that the public generally, and more especially the poor fishermen along our coasts and estuaries, should be injured and robbed of their means of subsistence and livelihood.

It will be acknowledged by almost all who have any practical knowledge of our rivers and their fisheries, that saw dust and other mill rubbish is decidedly injurious, and it is quite correct in saying that in all countries where salmon and trout are found, a law against the throwing of sawdust in the rivers exists. In our Dominion such a law was enacted, and for a time enforced, but by some strange misconception of the fact existing, here, in the Province of Nova Scotia, where salmon were formerly most abundant, and where a very large number of the inhabitants are, and for years have been engaged in this particular fishery, this law, for some years past, has not been enforced, with the result of a gradual but certain decline in the numbers of salmon caught or entering our rivers. There are many opportunities of witnessing this evil in this Province, and there will be no error in saying that the influence by which the exemption of the rivers from the sawdust clause of the Act was most decidedly against their best interests, and has entailed upon our river and estuary fishermen a direct and heavy loss.

Repairs, &c.

A considerable amount of work will be required about this hatchery during the next summer. The floors, tanks and other portions of the interior have suffered decay, caused by the constant dampness existing about this description of building. The floor, joice and portions of the studding, as well as the entire floor, requires renewing, but instead of renewing these with wood, I would suggest putting in a floor composed of rocks, gravel and sand, covered with a coating of cement. Such a floor would last for all time, and could be so constructed that perfect drainage would be secured, and all foul air from the decaying wood would be avoided.

While effecting this change there should be also an alteration in the arrangements of the troughs, substituting the transverse position of the hatching troughs for the present. This would give additional hatching capacity, and help to carry on the work more satisfactorily.

While suggesting the above changes and repairs, I beg to draw your attention to the very inadequate accommodation the rooms over the hatchery afford as a dwelling. I was informed by the late Commissioner that these rooms were never intended for occupation, at least by a man with a family, and I believe an effort was made at the time to secure a cottage in the vicinity as a residence for the officer in charge. This has not been done, and I have been compelled to put up with the poor accommodation which a few small rooms afford for a family of ten. You will readily understand how entirely insufficient this is, and being, as I am, one of your oldest officers, I trust you will be pleased to give instructions to secure for me, at least, as comfortable accommodation for my family as has been supplied at the other hatcheries. By the addition of a wing to the present building, or by adding another story, the required rooms could be obtained, and at no very great expense.

Hoping the above statements of my proceedings in the past year, together with the remarks and suggestions I have felt called upon to make, may meet with your approbation.

I have the honour to be, Sir,

Your obedient servant,

A. B. WILMOT,

Officer-in-Charge.

4.—DUNK RIVER FISH HATCHERY.

PRINCE EDWARD ISLAND, 31st December, 1884.

The Honourable A. W. McLELAN,

Minister of Marine and Fisheries, Ottawa.

SIR,—As was previously reported, the young salmon fry were successfully planted last spring in the following rivers, namely:—

	Fry.
Dunk River.....	300,000
Wilmot's River.....	200,000
West River.....	100,000
Morell River.....	50,000
Brustiwell River.....	50,000
Montague River.....	50,000
Wheatley River.....	50,000
Trout River.....	50,000
Hunter River.....	50,000
Trout River.....	50,000
Otter River.....	50,000
Total.....	<u>1,000,000</u>

At the present time there are laid down in the hatchery one million two hundred and fifty thousand (1,250,000) eggs in good condition. I thought at one time we would get scarcely any ova, owing to the water being so low in the river, they would not enter the "reception" house. A large number of fish spawned in the river, but when the wet weather set in and the water became dirty, they began to come in the house. Some fish entered as late as the 30th of November. On the 28th of November they came in faster than I could spawn them. We had in all two hundred and twenty fish (220) fish, one hundred and sixty (160) females and sixty (60) males. They averaged a trifle over seven thousand eight hundred (7,800) eggs each. I think there were quite as many fish that spawned naturally in the river as came in the house. A large number of grilse entered the reception house, but owing to the traps being too large to hold them they escaped. Only two fish died; these were hurt in the trap.

Young smolts were very numerous in the Dunk River this summer, and in Wilmot's River anglers reported them as never having been so plentiful before. In fact all the rivers I have heard from give the same flattering account. A large number of salmon entered Wilmot's River this fall, weighing from ten to twelve pounds. Some fifteen fish were taken by means of bait near the tide or salt water, several were also hooked with the fly but were not caught, owing to a proper salmon rig not being used. I saw eight fine salmon between the hatchery and the bridge, in the month of July; these I think could have been taken by means of a fly.

A very heavy freshet of last spring nearly carried away the reception house it, however, did considerable damage, having carried away about 24 feet from the broadside of the house. The water was 4 feet 8 inches high in the hatchery and floated all the troughs about the house, but fortunately no serious harm was done. Since the freshet I have had the troughs securely fastened, in order that they may not be disturbed again should another freshet occur. The dam and reception house have been repaired and everything is now in good working order.

It will be necessary to purchase some new cans for conveying the fry in the spring, as the ones in use are made of common tin, and are altogether too slight, and will not stand the rough handling they are subject to.

I am pleased to say that sawdust has not been thrown in the river, except on one occasion, and I think we will not be troubled very much with this evil in the future.

It is very difficult to keep poachers off the river. They are continually on the look-out, and if it were not for the exertions put forth by the wardens and myself, the salmon would soon be exterminated. Poachers have made daring attempts to fish several times, but they have been driven off without catching any fish. It is almost impossible to catch these parties, owing to the thick woods in this locality.

I have endeavoured to give you all the particulars in regard to the working of this hatchery, and trust they may meet your approval.

I have the honour to be, Sir,

Your obedient servant,

HENRY CLARK,

Officer-in-Charge.

5.—ST. JOHN RIVER HATCHERY.

RAPID DES FEMMES, ST. JOHN RIVER, 31st December, 1884.

The Honourable A. W. McLELLAN,
Minister of Marine and Fisheries, Ottawa.

SIR,—I have the honour of making the following report on the operations carried on at the Dominion salmon hatchery, situated at the Rapid des Femmes stream, on the St. John River, in the Province of New Brunswick.

In the fall of the year 1883 I reported having laid down in the hatchery two hundred and eighty-four thousand (284,000) salmon eggs, collected on the Serpentine, a tributary of the Tobique River. Later in the season, through your kindness, I received a further supply of eggs from Tadoussac, Province of Quebec. I went to St. John to meet them, but they suffered considerably on the way. When they were placed upon the trays, and thoroughly picked over, there remained, by approximation, two hundred and ten thousand (210,000) eggs. In the month of March I received a still further supply from Mr. Alexander Mowat, of the "Dee Side" hatchery, on the Restigouche River, of four hundred thousand (400,000) eggs, making in all eight hundred and ninety-four thousand (894,000) ova laid down in the hatchery, all of which, I am pleased to state, did remarkably well.

In the latter part of the month of April the eggs began to hatch, the Restigouche ova hatching out about eight or ten days in advance of the others. About the 25th of May all the eggs had hatched. The Restigouche eggs were a splendid lot—large and well formed, and hatched out with comparatively little loss, and developed rapidly. I confidently hope that they will improve the quality as well as the quantity of salmon in these rivers.

On the 18th of June I commenced to plant the young fry, and finished the work the 10th of July, an operation that was successfully carried out with but very little loss of young fish.

By orders, they were planted in the following named rivers, viz.:—

	Fry.
St. John River, Victoria County.....	461,000
Tobique do do do	150,000
Salmon do do do	100,000
Skiff Lake, York do	30,000
Baker Brook, Madawaska do	30,000
Emerson do do do	10,000
Rapid Des Femmes Stream	30,500
Total.....	811,500

During the remainder of the summer I overhauled and cleaned out the entire hatchery and varnished the troughs, trays and main tank, and made all other suitable arrangements to receive a new supply of eggs in the fall of 1884. The hatchery is now in complete running order in every particular. I do not consider it second to any other in the Maritime Provinces.

I was much pleased with a visit from the Superintendent of Fish Culture last summer. He made a thorough examination of the house and premises, and no doubt he will give the Department the benefit of his inspection.

On the 28th of last September I left here for the Tobique River, in quest of parent salmon to stock the hatchery. I am sorry that I was not as successful as could be desired, but under the circumstances it could not very well be otherwise, as the special warden that was appointed to guard the spawning grounds did not receive his appointment until it was too late, consequently the "Serpentine" was completely devastated by poachers almost a month previous to the warden's appointment. If he had been appointed about the 15th of June (as I expected he would be), I have no doubt in my mind but that I would have got at least six hundred thousand (600,000) ova. As it was, I only caught forty-three (43) salmon, twenty-five (25) females, and eighteen (18) males, from which I got one hundred and eighty-six thousand (186,000) eggs. These were the largest and finest salmon I ever caught on the Tobique. On the 25th of October I got home to the hatchery and placed the eggs on the hatchery trays.

There is an excellent supply of water in the hatchery this winter. Previously, there was much trouble with the water getting low in the house, and on one occasion it stopped running altogether, owing to a defect in the dam. This fall a contract

was given to have the dam and water course-repaired, and now there is an abundance of water to withstand the severe frost this winter.

It is to be regretted that the supply of eggs in the hatchery is so small, as the arrangements of the house are complete, with sufficient room and appliances for several millions of eggs. I would, therefore, respectfully request that a few hundred thousand ova be sent here from some of the other houses having a large supply on hand. I am in hopes that in a few years the rivers here will be so improved that there will be no difficulty in obtaining a sufficient supply of salmon eggs to fill this establishment. The only thing needed to accomplish that much-desired end, is strict protection. There can be no doubt but that these rivers are well filled with young salmon "parrs," from 4 to 6 inches long. I have observed numbers of them along the river, more particularly in the cribs where the salmon were kept for spawning. I was informed by an old fisherman that he saw fully a thousand of these young salmon in one place at the mouth of the "Narrows," on the Tobique River. Quite a number of "grisle" were taken in the river when fishing for parent salmon. These would weigh from two to four pounds. Many of the "parrs" and "smolts" are killed by parties fishing; and this practice is not confined to boys alone, but to grown up persons as well. I have repeatedly cautioned the people against killing them, and if they hooked any of these fish to take them off carefully and let them go; but this advice goes unheeded, as the cupidity of the generality of fishermen is beyond control.

I must again refer to the question of protection. If a good and efficient guardian is not appointed to strictly guard and protect the head waters of the Tobique River, by the 15th day of June each year, it will be impossible to get even a small supply of salmon eggs from it for this hatchery. If I were permitted to make some arrangements with the fishermen in the spring of the year to purchase salmon from them, perhaps something might be done towards getting a moderate supply, in connection with the other methods. There are three things which must attend the present method of obtaining salmon eggs here—slavish labour, with hardships; great expense compared with the small results, and very great uncertainty. I speak from experience. I have suffered severely in my efforts to capture salmon; combined difficulties make it exceptionally severe; namely, the extraordinary cold, stormy weather in the fall, and the uncommon low state of the water in the rivers. From this cause I was compelled to walk on foot fully one hundred and twenty miles through the woods in order to oversee the men's work. If the Superintendent of Fish Culture would devise some means of procuring a supply of ova for this hatchery, in like manner as at some of the other hatcheries, that would be satisfactory to the Department, I would most respectfully ask it to be done. But in case no other method than the present one will meet with the approval of your Department, I will nevertheless continue to do my utmost in succeeding years to secure as many eggs as possible.

Before concluding, I desire to refer to a novel occurrence that took place on the Tobique. It is well understood that rarely, if ever, has it been known that a salmon would rise to an artificial fly on the Tobique River, but last summer an American gentleman from Boston killed eighteen salmon with the fly on the right hand branch of the river. The question now presents itself, has artificial fish culture, by the introduction of fry from other rivers, caused this change? I am inclined to think it has.

With regard to the quantity of fuel consumed in this hatchery, it is about four tons of coal and twelve cords of wood per annum.

I have the honour to be, Sir,

Your obedient servant,

CHARLES McCLUSKEY,

Officer-in-Charge.

6.—MIRAMICHI RIVER HATCHERY.

MIRAMICHI HATCHERY, 31st December, 1884.

The Honourable A. W. McLELAN,
Minister of Marine and Fisheries, Ottawa.

SIR,— I beg herewith to submit to you my report of the fish hatchery under my charge.

In the spring of 1884 there were hatched and successfully planted seven hundred and ninety-five thousand (795,000) salmon fry, showing a small loss of ova while hatching.

The rivers in which fry were deposited are as follows :—

	Fry.
North-West Miramichi River.....	300,000
Little South-West Miramichi River.....	200,000
Big South-West Miramichi do	100,000
Sevogle River.....	100,000
Kenon's do	60,000
Stewart's Brook.....	35,000
Total	<u>795,000</u>

This autumn I succeeded in capturing two hundred and seventy-three (273) parent salmon. Of this number one hundred and sixty (160) were females, and one hundred and thirteen (113) males, from which I procured one million (1,000,000) eggs, showing an average of over six thousand (6,000) eggs taken from each female fish. The ova is progressing favourably up to the present time.

During the past summer your Superintendent of Hatcheries inspected this establishment, and ordered certain repairs necessary for the hatchery, which were completed. There was an entirely new cedar foundation put under the house, and a new floor put in the hatchery, constructed of pine deals. New hatching troughs were also put in; they were made of No. 1 pine boards, and were painted outside, and varnished inside with paraffine varnish, which tends to make them proof against decay. The walls of the hatchery were also lathed and plastered and newly clap-boarded, to add to the warmth of the building.

With regard to the information asked for by the Superintendent as to the results of my operations, I am sorry to say that his circular did not reach me in time to obtain much information to have put in this report so as to have it sent to him by the time required, but I know myself, and from what I have heard the net-fishermen say, that the salmon catch for this year, especially in the lower parts of the rivers, has been far ahead of any season for three or four years back.

I have also been told by a well known angler of Newcastle, on the Miramichi, that he never saw the river so well filled with "grilse" as they are this season. When my men were at work catching parent salmon for this hatchery, they would sometimes sweep in over one hundred "grilse" from one pool.

There are a great many more shipping establishments on the river now than there were a few years ago, and they are all doing a large business in fresh salmon. This all goes to show that the salmon must be on the increase in our waters.

I have the honour to be, Sir,

Your obedient servant,

ISAAC SHAESGREEN,

Officer-in-Charge.

ADDENDUM.

Since I sent my yearly report, I saw Mr. Timothy Crocker, of Newcastle, who is a large fish dealer, and we had some conversation on fish-breeding. He gave me his opinion on the subject as follows :—

He thought there was no doubt but the artificial hatching was a help to increase the fish, but he thought that we were hatching the wrong *run of salmon*. He said the summer fish did not seem to increase much, but the fall fish were very plenty the last two or three autumns, and he was very anxious to see the artificial process get a fair start, and not run it down until it got a good trial. He said I could use his name in this way.

I also saw Mr. Johnson, Postmaster at New Castle, New Brunswick, who is well acquainted with the salmon fishing. He would not agree with Mr. Crocker about the runs of fish; he thought they were all the same kind of fish in all the rivers. He had no doubt but that the artificial breeding of salmon was a help to keep up the stock in the rivers. He said salmon were holding out well, considering the way they were destroyed. From the time that salmon enter the mouth of this river until they get up into the smallest parts of the streams, they are hunted and captured in every shape and form. He was speaking from personal experience, as as he has been angling on all of our rivers for the last eight or ten years.

ISAAC SHEASGREEN.

P.S.—Mr. Crocker does a very large business in the fresh fish trade, and has been working among salmon since he was a boy.

7.—RRSTIGOUCHE RIVER HATCHERY.

RESTIGOUCHE HATCHERY, 31st December, 1884.

The Honourable A. W. McLELAN,
Minister of Marine and Fisheries, Ottawa.

SIR,—I herewith beg to submit the following report in connection with the working of this hatchery under my charge for the year 1884.

The fry hatched last spring and previously reported were planted in the following rivers :—

			Fry.
Nepisequit	River,	June 3rd.....	50,000
do	do	do 5th.....	50,000
do	do	do 7th.....	50,000
do	do	do 10th.....	50,000
Patepedia	do	do 16th.....	100,000
Upsolquitch	do	do 20th.....	100,000
Metapedia	do	do 23rd.....	100,000
Main Restigouche River	do	do 30th.....	440,000
Total.....			940,000

The fry planted in the Nepisequit River were conveyed ten miles by water and thence by rail to Bathurst and carried twenty miles up the river by means of teams, and distributed some twelve or fourteen miles up and down the river from canoes along the natural spawning beds.

J. De Wolfe Spur, Esq., the lessee of the river, took great interest in this work and rendered valuable assistance, as well as being personally present, and he expressed himself as being much pleased with the mode of carrying out the work, and the

healthy condition in which the fry were distributed. The fry planted in the Restigouche and its tributaries were all towed to their destination in cribs, this being a sure and most successful mode of distributing, as they are subject to a liberal supply of pure water of an even temperature all the while. A portion of the fry were carried fifty miles up the river, and appeared just as lively as when they left the nursery.

Besides the number of fry hatched and distributed, four hundred thousand (400,000) eggs were conveyed on the 22nd of January to the St. John River hatchery and placed in the hatching troughs in fine condition. The removal of these eggs to the St. John establishment was due to the limited space in the old nursery for them, and being afraid of overcrowding the fry in the spring. But I must say that I do not approve of such a course of transporting ova or young fish from their native or parent river if it is possible to avoid it. In my opinion strenuous efforts should be put forth, for each hatchery to secure a supply of eggs from the river it is located on. Such a course would seem more justifiable.

Parent Salmon.

Our nets at "Tide-head" to capture parent fish were set on the 1st of June. Owing to high water and strong currents in the river, no fish were taken until the 10th of the month and fishing was over on the 10th of August. We succeeded in capturing one hundred and eighty-six fish, seventy-eight females, seventy-three males, and thirty-five "grilse." Thirty (30) salmon were purchased from James Gillis, lessee of an adjoining station, but as they were caught in large meshed nets they were more or less injured and died from the growth of fungus in their gills. Those caught in our own nets were kept in a good healthy condition, and from them was collected seven hundred thousand (700,000) eggs, which were packed in moss and conveyed by rail, water and carriage to the hatchery. They are at the present time in fine condition.

New Hatchery.

In accordance with instructions received, the work on the new hatchery was commenced in August and continued until cold weather stayed operations. It is, however, well on towards completion, and the whole of the material is on hand to finish the work, excepting brick and lime. The tank and troughs have been ordered, and will be ready for fitting up early next summer.

As the new hatchery is calculated to hold upwards of four millions of eggs, it will be absolutely necessary to obtain a large stock of parent fish next year, and to put up a small building for the use of the guardian as well as to spawn and strip the fish in. We had very great difficulty this fall in preventing the ova from freezing during the process, and a great deal of suffering was experienced by us in manipulating the fish, from the severe cold, which had already frozen over the pond.

Owing to the coast nets now taking an undue proportion of the salmon before reaching the estuary, the Department will have to arrange with the proprietors of the two nearest stations to the receiving pond to supply salmon to be taken in small mesh pound nets at current market prices, and a proviso to that effect should be inserted in their licenses for 1885. Their names are James Gillis and Melvin Adams. These parties should be at once notified of this requirement, in order to prepare nets suitable. If they refuse to comply, the Department will be compelled to take these stations under its own control, as I cannot see any other mode of getting a sufficient number of parent fish for the hatchery. Had I been permitted to supplement the stock of parent fish from the river this season, as usual, I could have easily obtained another half million of ova for this hatchery.

It appears the run of salmon here are quite different from the Miramichi or Nova Scotia salmon. There they come in as late as October, ripe and ready to spawn, and they are taken at the head of estuaries without difficulty. In these rivers salmon all

run during five or six weeks, often in two weeks early in the season. None enter in September or October.

As for the benefits of fish culture, I may mention that, in 1883, seventeen hundred (1,700) fish, or thirty seven thousand (37,000) pounds of salmon, were caught with the fly by anglers on the main Restigouche alone. Mr. Porter Mowat, fish dealer in Campbelltown, purchased one hundred and twenty thousand (120,000) pounds, Messrs. Hogg & Nye, sixty thousand pounds (60,000) from fishermen. Allowing fifty thousand (50,000) pounds for home consumption, there would be a total (for this portion of the division) of two hundred and sixty seven thousand (267,000) pounds. These figures can be verified, and are very different from the overseers' reports, which show nearly one half less. This year, above Dalhousie, fishing has been poor, fully one-half less than last year, while below that point, on what is termed the coast fishery, it has been excellent. The freezers are all full, and railway returns give figures of nearly two hundred thousand (200,000) pounds of fresh salmon shipped from Bathurst alone.

Unfortunately the Restigouche is the only nursery for the Baie des Chaleurs. The coast netting is very extensively carried on, and being supplemented now by close traps also, they take the major portion of the fish, and unless some change can be made in the setting and limiting the length of those nets on the coast, our river or estuary fishing cannot expect the usual or requisite supply.

Very few salmon have been caught on the Matapedia or Upsalquitch Rivers by anglers. Those rivers seem to be deserted or barren. Fine sport has been had on the main river. For the last two or three years, it is the only salmon angling river we have.

I have the honour to be, Sir,

Your obedient servant,

ALEX. MOWAT,

Officer-in-Charge.

8.—GASPÉ BASIN HATCHERY.

GASPÉ FISH HATCHERY, 31st December, 1884.

The Honourable A. W. McLELAN,
Minister of Marine and Fisheries, Ottawa.

SIR,—I beg to submit a report of the operations at the Gaspé fish-breeding establishment during the past year.

The ova last winter did well. The weather was very cold and the water supply in consequence kept low. The young fish commenced hatching the end of May. The removal of them was commenced on the 18th of June, and finished on the 25th of July. The work of distribution was stopped several days in July, on account of the high water. The following is the number of fry distributed in each river:—

	Fry.
Dartmouth River.....	592,000
York River.....	144,000
St. John River.....	114,000
Grand River.....	9,000
Total.....	859,000

On the 28th of July I sent six cans, with nine thousand (9,000) fry to Grand River by steamer "Admiral," and on the 31st inst. I had the following reply respecting them: "The young fry carried well. I do not think there were ten dead ones in the lot. Colonel Walker was pleased when he saw them on board the

steamer on Monday morning, and so smart. I placed four cans above the camp, and had hard work to get up river, it being so high."

In the month of July last I was honoured with a visit from Yourself, accompanied by your Superintendent of Fish Culture. The Gaspé hatchery then received your personal inspection. Mr. Samuel Wilmot also visited the receiving pond up river. Unfortunately, a heavy freshet was then running, which prevented the chance of seeing all the salmon that had been put in the reservoir.

The net for capturing parent fish was set on the 18th of June, and up to the 13th of July one hundred and three (103) salmon were captured. Owing to a 6 feet rise of water in the River Dartmouth, the net was removed on the 14th inst., and could not be set again until the 29th inst. Only four more fish were netted, making a total of one hundred and seven (107) fish put in the reception pond.

Manipulation of Fish.

The salmon were seined and placed in cribs on the 3rd of October. It was then seen that twenty (20) fish must have escaped during the July freshet, when a breach in the dam was made, as only eighty-five (85) fish could be found. Search was made some distance up the brook, but in vain. Although the water was very low, and scarcely any rain fell since the 1st of August, the fish were unusually late in spawning. They did not shed their ova until the 16th of October, and by the 8th of November the work was completed.

There were 38 female fish and 47 males, making a total of 85 parent fish manipulated for breeding purposes during the fall of 1884.

The number of eggs collected from these fish and laid down in the hatching troughs was two hundred and forty-five thousand (245,000).

On Wednesday, the 5th of November, a very high tide, with easterly wind and snow storm, had the effect of killing a large number of trout, and the following morning the watchman on going up the brook found some salmon dead in the scow, cribs, and stream. From the effects of the storm the water had a bad taste, and appeared about the color of indigo. I suppose the high tide must have carried up mud, or some injurious substance of a poisonous nature, which caused mortality amongst the salmon. The sudden advent of wintry weather prevented the remaining fish being carried round to the main stream.

Operations at Barachois.

In accordance with Mr. Wilmot's instructions, a telegram was sent Mr. John McCallum on the 14th of October, to secure as many parent fish as possible, and twenty-eight (28) were caught and placed in the pond. Spawning commenced here on the 3rd of November and finished on the 8th inst. There were fifteen (15) females and eleven (11) males, which gave ninety-six thousand (96,000) eggs. Two fish remained in the pond, and could not be caught on account of the long grass. The salmon were marked and carried out to the main river. The fish handled here and at Gaspé were all small sized-ones.

Mr. McCallum has observed that salmon enter the Barachois River much earlier since young fish were planted there. For instance, in 1874 salmon only entered the pools the end of August; and this year some came up as early as the end of June, and many more fish are now seen than formerly.

Repairs of Hatchery.

In accordance with instructions received, I purchased two thousand (2,000) feet of 2-inch pine flooring. I commenced removing the old floor on the 6th of August, and found that all the troughs were decayed. I therefore purchased sixteen hundred (1,600) feet of inch boards and engaged a carpenter, who commenced work on the 11th of August and finished the work on the 17th October. Having placed a

new floor and troughs throughout, I filled in between the sleepers with stone and sand, and replaced the zinc tubes in the reservoir by wooden taps, which are a great improvement and will prevent, to a great extent, the leakage of water on the floor. The cost of this extra work has been one hundred and eighty-three dollars (\$183.00).

General Remarks.

The three hundred and forty-one thousand (341,000) eggs now in the building are a small number compared with last year. The water supply would be quite inadequate to run the troughs were they filled with ova this season, and unless there is a rainfall before the cold weather sets in, I anticipate having to remove all the trays to the three lower boxes.

New galvanized iron stovepipes have been got, as the old ones were rusted and decayed with the dampness arising from the continual flow of water through the building. Finding, also, that the stove in use was unsafe, I ordered a new coal stove from Quebec.

Before closing I may be permitted to insert here the views entertained by Colonel Walker, lessee of the Grand River, with regard to the benefit resulting from the operations at the Gaspé hatchery. He says, when giving in his angling score, thus: "I think it an ascertained fact beyond doubt that the majority of salmon now being caught in this river are the result of stocking it with fry from the Gaspé hatchery."

I have the honour to be, Sir,

Your obedient servant,

PHILIP VIBERT,

Officer-in-Charge.

SUPPLEMENT.

The following remarks I beg to submit with my report on fish breeding:

"The whole system of fish culture should be closely studied by all those in charge of the several hatcheries now in operation, with a view to ascertain if there be any defects in our system: The best mode of securing the fish. The size of retaining ponds for penning them in. Manipulation of the fish. The safest plan for carrying the ova to the breeding house. The easiest and most economical system of planting the young fry in the rivers. The cans most suitable for conveyance. The distance the young fish should be placed up stream. All these details, and others too numerous to mention, should be mutually discussed by fish culturists. A conference of the officers in charge of the establishments with the Superintendent of Fish Culture might lead to a large amount of information on this important public topic." The present system of watching some of our valuable salmon streams is not calculated to improve the river and coast fisheries, and in some cases too many licenses for salmon nets have been granted. Great care and supervision is needed at all salmon rivers, where smelt, trout and other fish are seined by cod fishermen for bait, or otherwise, in order that young salmon may not be destroyed, as they too frequently are.

Respectfully,

PHILIP VIBERT,

Officer-in-Charge, Gaspe Hatchery.

9.—TADOUSSAC HATCHERY.

TADOUSSAC FISH HATCHERY, 30th November, 1884.

The Honourable A. W. McLELAN,
Minister of Marine and Fisheries, Ottawa.

SIR,—I have to report that there was hatched out at the Tadoussac hatchery 985,000 salmon fry, disposed of as under :—

	Fry.
In St. Margaret, North-West Branch.....	230,000
do North East Branch	90,000
Petit Saguenay River.....	180,000
L'Anse St. Jean River	225,000
Petite Isle River.....	50,000
In small streams running into fish ponds near the hatchery	210,000
	<u>984,000</u>

The salmon rod fishing has been good in most of the streams in my district, especially L'Anse St. Jean, Petit Saguenay and the River à Mars. The lessees are well satisfied with their sport, and the guardians report plenty of parent fish in them.

The St. Margaret River, north-west branch, is not fished as well as usual. In the northeast branch the fishing has been bad, which I attribute, to a great extent, is owing to a change in the channel of the river at the forks, where it joins the north-west branch, the channel being partially blocked up with stones, rocks and gravel, the result of the banks of the river being washed away. The guardians report breeding fish in the two rivers plentiful.

A great number of smolts have gone from our ponds to the salt water this year, and I have no doubt this mode of allowing them to go when they are able to take care of themselves, will prove a great success.

The salmon net fishing has not been quite so good as usual, which I attribute to their being cut off by nets on their passage upwards. The fish came up from the sea later than usual.

We secured for the hatchery this season, two hundred and seven (207) parent salmon; one hundred and seven (107) females, and have now on the trays in the hatchery, seven hundred and seventy-five thousand (775,000) ova, many of the female fish being small, have not yielded as much ova as usual.

The hatchery will require some repairs next year, the flooring, water tanks, and especially the foundation. The heavy gale and high tides of the 5th and 6th inst., have floated the wharves around the hatchery, uncovering some part of them and washing away some of the planking and facing of them.

Our dams are in good order and retain the water well.

I remain, Sir,

Your obedient servant,

JOSEPH RADFORD,

Officer in charge Tadoussac Hatchery.

10.—MAGOG HATCHERY.

MAGOG FISH HATCHERY, 31st December, 1884.

The Honourable

A. W. McLELAN,

Minister of Marine and Fisheries, Ottawa.

SIR,—I have the honor to submit the following report of the work in connection with the Magog fish hatchery for the past year.

I commenced seining for lunge or salmon trout in Lake Memphremagog on the 11th day of October, 1883, and succeeded in catching and depositing in the pens at the hatchery, one hundred and eighty (180) parent fish, from which I obtained one hundred and sixty thousand (160,000) eggs.

As you have heretofore been informed the "Magog Textile and Print Company" in 1882 purchased the water power on the Magog River, and commenced building a dam across the said river below the hatchery. The dam was not fully completed in the fall of 1883, so the water could not be raised to a sufficient height to put in operation the new hatchery which (by arrangement with your Department) had been erected and located near the new dam on a site selected by your deputy, Mr. W. F. Witcher, in the fall of 1882.

The dam in question, though left in the fall of 1883 in an incomplete state, was raised high enough to cause the inundation of the hatchery to the depth of several feet during a freshet. When informed by Samuel Wilmot, Esq., inspector of fish culture, that he proposed to forward to the Magog Hatchery a large number of eggs from Newcastle, I explained to him that it would be unsafe to attempt to take care of more eggs than we then had on hand.

When the rains came in the spring, the water rose until it was four feet in depth over the floor of the hatchery, and it was with the greatest difficulty that the stock of eggs on hand was saved. In order to do so I was compelled to deposit the stock on hand in Lake Memphremagog before full development.

The aforesaid dam is now fully completed, and everything is in good order for successful work, so far as relates to the hatchery building, machinery and water. Still further work in the building of fences around the grounds and the construction of pens may be required.

In regard to the fall operations, I beg leave to say that I commenced seining on the sand banks in Magog Lake on the 13th of October, and continued the work until driven off by storm and wind. When the weather moderated the fish had left the sand beds and gone further out in the lake to the spawning grounds on the gravel shoals, where it was impossible to follow them. I then moved my men up the lake about eight miles, to Lords Island, where we seined for several days, and succeeded in catching a good many fish, but unfortunately, nearly all of which were caught in both places were males, and what few females there were taken at the last named place had spawned. So that while I caught about one hundred and fifty (150) parent fish, I was unable to secure eggs enough to be of any importance, and in consequence, the Magog Hatchery will have to depend upon other sources for its supply of eggs for the ensuing year.

I now beg to report what I have before stated, that, were you to authorise the expenditure of a small amount of money in preparing the spawning grounds for seining, a sufficient number of parent fish could be caught to stock the Magog Hatchery very fairly each year, and quite enough to make it practically independent of the western lakes in Ontario, and result in increasing to a satisfactory extent the supply of fish food in the various sheets of water in the Eastern Townships.

In order to learn the opinion of competent judges regarding the effect which the propagation of fish in the Magog Hatchery has had upon the production for the past year or two, I addressed several letters to prominent men living near Lake Memphremagog, and requested answers. Amongst those which have been received, I have the honour to forward the following copies for your perusal, which will, I trust, serve

to convince you that the work and expenditure in connection with this establishment has not been devoid of good results. I am confident that the increase in the numbers of salmon trout in Lake Memphremagog during the past two or three years would amount to fully as much as the expenditure which has been made for their production. The information which I get from reliable sources in connection with my own personal knowledge, convinces me that salmon trout are increasing very rapidly, that they are much larger than what were formerly caught, and that it is in a great measure owing to artificial production and better protection during the "close season."

All of which is most respectfully submitted.

Your obedient servant,

A. H. MOORE,

Officer in Charge.

GEORGEVILLE, 20th November, 1884.

Mr. A. H. MOORE, Magog.

DEAR SIR—In reply to your questions as to the effects the deposit of small fry from the Magog Hatchery in Lake Memphremagog has had upon the fish production in said lake, I have to say that, there is no denying the fact that there are more fish in the lake now than there ever were before, and I cannot account for the rapid increase except it be through the work of an artificial production, and the protection of the fish during the "close season."

Yours truly,

W. H. KEYES, M.D.

GEORGEVILLE, 22nd November, 1884.

Mr. A. H. MOORE, Magog.

DEAR SIR,—In reply to your enquiry regarding the effects of the artificial propagation of fish and their protection in Lake Memphremagog, I beg to say that I have lived near the shore of the above mentioned lake for over twenty years. During that time I have had some knowledge of the state of the lake respecting the quantity of fish caught each year, and I am fully convinced that there has never been a time when salmon trout were as plentiful in this lake as they now are. I am aware that some sixteen thousand pounds (16,000) have been caught with the hook during the past year. I attribute the extraordinary increase to the large quantities of small fry hatched in the Magog Hatchery and deposited in the lake, and the protection of the salmon trout during the "close season."

Yours respectfully,

N. A. BEACH.

GEORGEVILLE, 22nd November, 1884.

A. H. MOORE, Esq., Magog.

DEAR SIR.—You ask to know what my opinion is regarding the increase of salmon trout or "lunge" in Lake Memphremagog.

I have had an opportunity of noticing the condition of the fishing business upon the above named lake for fifteen years, and of inspecting the fish on the shoals during the "close season" and along the shore for that length of time, and there has not been a year when the salmon trout has been so plentiful as they were this season. They could be seen in large quantities in the day time, on their spawning beds and in shoal places and they appear to be larger than usual.

I believe that the increase of fish is due to the Magog Hatchery, and also to protection during the close season.

I am, dear Sir,

Yours very truly,

WM. M. GOWAN, JR.

MAGOG, 27th November, 1884.

A. H. MOORE, Esq., Magog.

DEAR SIR.—Your letter of the 16th October, was duly received, and in reply I beg to say that I have lived near Lake Memphremagog nearly all my life and have been engaged in fishing, more or less for over twenty years, and there never has been a time within my recollection, when the "lunge" or salmon trout, were as plentiful as they are now. I know of several fishermen who have made from \$25 to \$50 per month, by fishing in the lake during the past summer with hook and line.

I have seen more beds on the shoals or the spawning grounds this year, than I ever saw before. I cannot account for this great increase in any way, unless it be caused by the protection of the lake, and by the deposit of small fry from the Mogog Hatchery.

Yours very truly,

D. E. PETERS.

11.—NEWCASTLE HATCHERY.

NEWCASTLE FISH HATCHERY, 31st December, 1884.

The Hon. A. W. McLELAN,

Minister of Marine and Fisheries, Ottawa.

SIR,—I have the honour herewith to submit to you my Annual Report of Fish Cultural Operations connected with this establishment for the past year.

The total number of fry of all kinds hatched and distributed from the Newcastle nursery, during the spring of 1884, was eight million eight hundred thousand (8,800,000), which were divided by species as follows:—

Salmon trout.....	5,150,000
White-fish.....	3,500,000
Speckled trout.....	50,000
Black bass.....	100,000
Total.....	8,800,000

These were successfully planted in the following named waters in the Province of Ontario:—

White-fish.

Lake Ontario.—Newcastle, County West Durham.....	500,000
do Bowmanville, do	500,000
do Cobourg, do E. Northumberland..	500,000
do Toronto, do York.....	500,000
Lakes in Addington and Frontenac Counties.....	500,000
Lakes in Scotland, on Marquis of Lorne's estate.....	500,000
Lakes in Ottawa district.....	500,000
Total.....	3,500,000

Salmon Trout.

Lake Ontario.	Newcastle, County	West Durham.....	500,000
do	Toronto, do	York	600,000
do	Oakville, do	Peel	200,000
do	Hamilton, do	Wentworth	200,000
do	Port Hope, do	East Durham	100,000
do	Cobourg, do	W. Northumb'l'd ...	300,000
do	Whitby, do	South Ontario.....	100,000
do	Picton, do	Prince Edward....	100,000
do	Bowmanville, do	West Durham.....	500,000
do	Brighton, do	E. Northumb'l'd...	100,000
do	Kingston, do	Frontenac	500,000
do	Belleville, do	South Hastings....	100,000
do	Niagara, do	Lincoln	200,000
Lake Simcoe.	Barrie, do	Simcoe	100,000
do	Orillia, do	Simcoe	100,000
Lake Erie.	Port Stanley, do	Elgin	200,000
do	Port Dover, do	Norfolk	200,000
Georgian Bay.	Wiarton, do	Bruce	200,000
Lakes in North Riding of Hastings.....			100,000
Muskat Lake, County of Hastings.....			100,000
Lakes in Addington and Frontenac Counties.....			200,000
Lakes in County of Leeds.....			100,000
Stoko Lake, north of Belleville.....			100,000
Lakes in Ottawa district.....			250,000

Black Bass.

Lakes in North Riding of Hastings.....	50,000
Lakes in Stanstead County, Quebec	25,000
Pond at Newcastle Hatchery.....	25,000
Total.....	<u>100,000</u>

Speckled Trout.

Distributed in various streams in Ontario	50,000
---	--------

The white-fish eggs shipped to Scotland for the Marquis of Lorne were reported as having reached Inverary in good condition. Considering the long distance these eggs were transported, it is very gratifying, indeed, to have such a favourable report of them. The salmon trout and white fish eggs which were, by orders from the Superintendent, sent to Ottawa, reached their destination safely, and were hatched in the Fisheries Museum and successfully distributed in several lakes in the Ottawa district.

With regard to the general distribution of fry from this hatchery in the spring of 1884, I am pleased to state that the young fish were liberated with but little loss. Some of the points where they were distributed were a long distance from the hatchery, and before the work was completed the weather became very warm. Notwithstanding this fact, and the many difficulties connected with the planting of fry at such great distances, they reached their destinations in a healthy condition, with the exception of two shipments, intended for Owen Sound and Meaford. These, however, were planted in Lake Ontario, opposite Toronto, as they showed signs of exhaustion after remaining over night to connect with the train going north in the morning.

Just at the time when the fry were about hatching out, a portion of the dam was carried away by a heavy spring freshet. This caused a great deal of anxiety, and considerable trouble was experienced in order to keep the fry alive. The water in the upper hatching room was completely stopped when the freshet subsided, and it was found necessary to remove the eggs down stairs. As the lower flat was well filled with eggs, those brought from above made the lower hatching troughs overcrowded, and it was feared at one time that they would all suffocate for want of a sufficient supply of aerated water. However, the small supply of spring water otherwise used was conveyed into the tanks outside, and as the fry hatched out they were transferred from the troughs inside the building to the spring water tanks in good condition, and no loss of any moment was sustained. The breakage in the dam was repaired at the earliest possible convenience, and it is to be hoped that it will give no further trouble.

By orders from the Superintendent of Fish Culture, this hatchery was repaired during the past summer. Portions of it were found to be in a very dilapidated state, and had become much decayed by dampness, from the continual flow of water through it since its erection; so much so that it was unsafe to even walk across the floors. New floors, sills and hatching troughs were put down in place of the decayed ones. The rooms were painted and white-washed, and the establishment generally overhauled, thus making it fully complete as regards its requirements.

During the fall of 1884 there were collected and laid down in this nursery upwards of seven million five hundred and fifty thousand (7,550,000) eggs. These are described by species as follows:—

Salmon trout.....	4,000,000
White-fish	3,500,000
Speckled trout.....	50,000
Total.....	7,550,000

The salmon trout eggs were obtained at Pigeon Island (Lake Ontario) and at Meaford (Georgian Bay). The white fish eggs were got from the Sandwich Hatchery, and the speckled trout from Tadoussac in Quebec. The Pigeon Island eggs are at present in a remarkably healthy condition. The Meaford ova do not look so well, but are in about the same condition as those gathered from the Georgian Bay in previous years. It is generally estimated that a larger percentage of eggs is hatched from those taken at Pigeon Island than from those collected at Meaford. This loss, in the latter case, is due to the following causes: (1) The nets are allowed to remain in the water at the Georgian Bay fisheries sometimes for ten days before being lifted, when many of the fish are dead; the eggs, therefore, become unsuitable for impregnation. (2.) Frost frequently kills the eggs while being collected at such long distances out in the lake, sometimes twenty-five miles from shore. (3.) In transporting the eggs to Newcastle by railway from Meaford, some (160) hundred and sixty miles, they are subjected to rough handling by express agents and others. In this way many losses occur.

Distribution of Fry.

In connection with the distribution of salmon trout fry from this establishment, I would suggest that the greater portion of the coming spring stock be planted in Lake Ontario. For some years past the fry have been distributed in many places throughout the Province of Ontario, in numbers ranging from one hundred thousand to five hundred thousand, in numerous localities, as may be seen in the schedules of distribution for 1881-2-3-4. This plan which has been adopted for some years past, does not give the hatchery such a fair opportunity as it is entitled to for showing what "practical results" can be accomplished in the way of re-stocking many depleted waters. If the coming spring's stock of fry were principally deposited in Lake Ontario, at suitable points, such as Newcastle, Port Hope, Toronto, Kingston

and some other places where it is known for a certainty that this species of fish has been in the habit of spawning naturally, and is generally caught for marketable purposes, there is no doubt but the Department would be able to show greater results in the increase of these fish. It is unwise to have the young fry distributed in small quantities at such long distances from the hatchery, and in so many different localities. It would be more advantageous to plant them otherwise, which might be thus: Lake Ontario to receive the fry for distribution from the hatchery in the coming spring, and some other important water could be stocked another year, and so on. These large deposits would then be more beneficial than the small supplies given to so many waters as heretofore. This is an important question for consideration, and the Department should take some active steps to have the plan now suggested carried into effect.

Water Supply.

The water supply at this hatchery is not as pure as it should be. Owing to various reasons the stream upon which the breeding establishment is erected has of late years become very much changed in its nature. At one time the water was pure, cold and limpid, but latterly, especially during the hot weather, it is warm, foul, and too unhealthy for the rearing of the higher orders of fish, which are hatched in this establishment. This unfitness, however, does not prevent the hatching of the better kinds of fish during the winter months, but it *does* very materially interfere with keeping the fry on hand afterwards and during the hot weather, as the water becomes so warm as to kill the fry.

It is a well known fact that, as a country becomes cultivated and cleared of its forests, and has manufacturing establishments erected upon its streams, the water in that section becomes unsuitable for the rearing of the salmonidæ family. The ploughed lands and the modern system of drainage carries decayed vegetable matter into the water. Barnyard drainage, also, runs into the streams; and manufactories, with their poisonous dies and other deleterious substances, completely pollute the water. The forests, also, with their shade trees, which were at one time standing on the banks of the rivers and brooks, gave cool shelter to the water. All these have now disappeared, and the extreme heat of the sun's rays has the effect of making the water excessively warm in the summer. To overcome this annually increasing difficulty an *artesian well* should be sunk here in order to have the hatchery at all seasons supplied with water of a good character. The cost of having this well bored would be trifling when compared with the many benefits to be derived from its usefulness. In this case the difficulties from spring freshets, which bring down great quantities of poisonous sedimentary matter upon the eggs, causing suffocation to the delicate fry, trouble to the employees of the hatchery, and expense to the Department, would be largely overcome; and, above all, the ponds now connected with the establishment could be used in the growth of young fish; whereas, in their present state, they are becoming almost useless. The foul creek water running through the ponds in the summer months causes weeds and filth of every description to grow so fast that it takes constant attention and considerable expense to keep them looking even respectable.

The grounds connected with this fishery are very picturesque in summer. They are visited by hundreds of people during the hot weather, and admired very much. If an artesian well were sunk to supply the ponds and hatchery with pure, fresh water, it would be a benefit in every way. Enquiries have been made in several localities where the artesian wells are in use, and it is found that they can be sunk with little expense, especially in this section of the country, where springy land abounds, and no obstructions are to be found in the way of rocks. It is to be hoped that the Department may consider it advisable to have this project carried into effect during the coming summer.

I have the honour to be, Sir,

Your obedient servant,

C. WILMOT,

Officer-in-Charge, Newcastle Fish Hatchery.

12.—SANDWICH HATCHERY.

SANDWICH, 20th December, 1884.

The Hon. A. W. McLELAN,
Minister of Marine and Fisheries, Ottawa.

SIR,—In obedience to the call made upon me by Mr. Superintendent Wilmot, to furnish a correct report of the doings in the Sandwich fish hatchery, on the Detroit River, of which I am in charge, I herewith send a statement of the operations for the past year, giving you a full account of the eggs gathered, the number hatched, and how disposed of.

In my last report I made a showing of having gathered thirty-five million (35,000,000) whitefish eggs at the different points along the Detroit River. Out of this amount of eggs I managed to hatch twenty-seven million (27,000,000), which I disposed of as follows:—

Peaché Island	2,000,000
Fighting Island.....	2,000,000
Bois Blanc Island.....	4,000,000
Leamington, Lake Erie.....	2,000,000
Pelee Island do	1,000,000
Port Stanley do	1,000,000
Belle Isle, Detroit River.....	2,000,000
Kent County, Lake Erie.....	1,000,000
Pigeon Bay do	1,000,000
Meaford, Georgian Bay	3,000,000
Niagara, Lake Ontario.....	2,000,000
At Hatchery, Detroit River	6,000,000
	<u>27,000,000</u>

The young fry were in a very healthy and lively condition when placed in the water at the different points, and I have the greatest hopes of hearing a good report of them in the future.

The amount of pickerel eggs gathered this last spring was fifteen millions (15,000,000), a much smaller amount than was gathered the spring before. This can be accounted for by two reasons. The first reason to be given is that the catch of pickerel this spring was very light: the second reason is that the Americans have taken a mania to hatch pickerel since we commenced the work, and are monopolizing all the fisheries on the American side, which side we have principally to look to for the eggs. The places where the eggs were got, and the numbers, are as follows:—

Weir Bros., Lake Huron.....	2,000,000
Loussau's do	1,000,000
Hickcock & Slochums, Lake Huron.....	6,000,000
Gauthier's grounds, River St. Clair, American side.....	5,000,000
Meloche's grounds, River St. Clair, Canadian side.....	1,000,000
Total.....	<u>15,000,000</u>

Six millions of these were planted in the river at the hatchery and four millions in River St. Clair, which makes a total of ten millions, all that were hatched. These figures show a decrease from last year's report, both in number of fish turned out and ova received. I had considerable trouble in collecting the eggs, which trouble I stated in my last report.

The hatchery was considerably run down and required some repairs, part of which I have had done. In my last report I stated that a new pipe was required to

lead to the river. Not having received any instructions in regard to it at this time I had a screen made to cover the mouth of the pipe, the last and all previous screens having been broken and torn away by the flow of ice, which is very heavy here in the winter. The screen is working well at present, and I expect that I will be able to get along admirably well with it this winter.

From information received from the different fishermen along the Detroit River, I have every reason to believe that the catch of whitefish this year will be much greater than that of last year, but as the fishing season is not more than half over, I cannot give as adequate a report as might be required at the present time of writing, but will send it on when spawning time is over.

ADDENDUM.

SANDWICH, 20th December, 1884.

The spawning time of whitefish is now over, and I send my report of this fall's operation in collecting eggs, as promised.

The catch of whitefish this fall has been somewhat in advance of that of last season, and from every information received from a majority of the fishermen along the Detroit River, I am given to understand the catch has been quite satisfactory. Of course there have been some grounds that had a smaller catch this fall than last, and in consequence caused some fishermen to be dissatisfied; but if the catch had been three times what it was, these same men would have been grumbling because they did not catch still more. On the whole, the catch is an increase from that of last fall. I have just filled the hatchery with ova from the following grounds, from which I secured fifty million eggs. The numbers of whitefish eggs at each place are as follows:—

McKees, Bois Blanc Island.....	25,000,000
Reume's, Stony Island.....	24,000,000
Meloche's, do	1,000,000

Making the total now in hatchery..... 50,000,000

These eggs are looking well and are in a healthy condition. The improved "Wilmot jars," which we are using, do their work so well that it is very easy to detect the bad eggs in the glass incubators. On this account I expect to turn out a very large percentage of the ova now in course of hatchery.

Enclosed with this report of my proceedings will be found a memorial signed by most of the principal persons residing here, setting forth their views with regard to the benefits realized from the work done at this hatchery.

I have the honour to be, Sir,

Your obedient servant,

WM. PARKER,

Officer-in-Charge.

MEMORIAL.

SANDWICH, 11th December, 1884.

To the Honorable the Minister of Marine and Fisheries :

We, the undersigned members of the Councils of Sandwich Town and Sandwich West Township, and principal fishermen along Detroit River, and others, interested in the welfare of the County of Essex and its industries, do feel a deep interest in

the maintenance of the supplies of white fish and other kinds of fish in this section of the county, and desire to express our belief in the benefits which are derivable, and have been realized from the large number of young white fish and pickerel which have been bred and turned out from the Government fish hatchery at Sandwich, on the Detroit River. And further, we do believe that the Government, in its wisdom, is looking to the interests of the people of this section of the county in the maintenance of the said hatchery.

Arthur C. Verner, mayor.	Danl. Meloche, fisherman.
James McKee, reeve.	Wm. Overton do
F. Bridges, councillor.	R. Gignac, ex-reeve and fisherman.
James A. Stewart, clerk District Court.	Joseph Parre do
Louis Rafferty, ex-reeve.	James Smith do
R. Gluns, councillor.	Robert Adamson do
Thos. H. Wright, Co. Treasurer, Essex.	Jos. D. Meloche do
Pierre Domillard, reeve, Sandwich W.	Henry C. Bell do
Noël Jolie, deputy reeve do	C. Berritan do
Elisha McKee, councillor do	Geo. A. Gauthier do
Wm. Benson, collector of Customs.	Wallace Gauthier do
J. Davis, inspector of distilleries.	C. H. Ashdown, public school teacher.
C. A. Pequegnot, merchant.	Joseph Allen, fisherman.
G. W. Mason do	Frank E. Marcome, deputy clerk H.C.J.E.
John Speers do	J. C. Iler, sheriff.
C. W. Gauthier, fish dealer.
